USEPA	United States Environmental Protection Agency
WID	Woodbridge Irrigation District
mg/L	milligrams per liter
SMCL	secondary maximum contaminant level
MCL	maximum contaminant level
Sy	specific yield

## GLOSSARY OF TECHNICAL TERMS AND CONCEPTS USED FOR THE PROJECT

A large portion of this project is a scientific investigation. Several technical terms and concepts regarding the nature of groundwater aquifer systems and their source of water are discussed. The following presents a general overview of the technical terms and concepts that the reader will encounter throughout this document. It is intended that this Feasibility Report will provide all interested readers the necessary information to comprehend the current understanding of potential groundwater recharge at the Delta Water Treatment Plant facility to allow proper management and protection of this important regional asset.

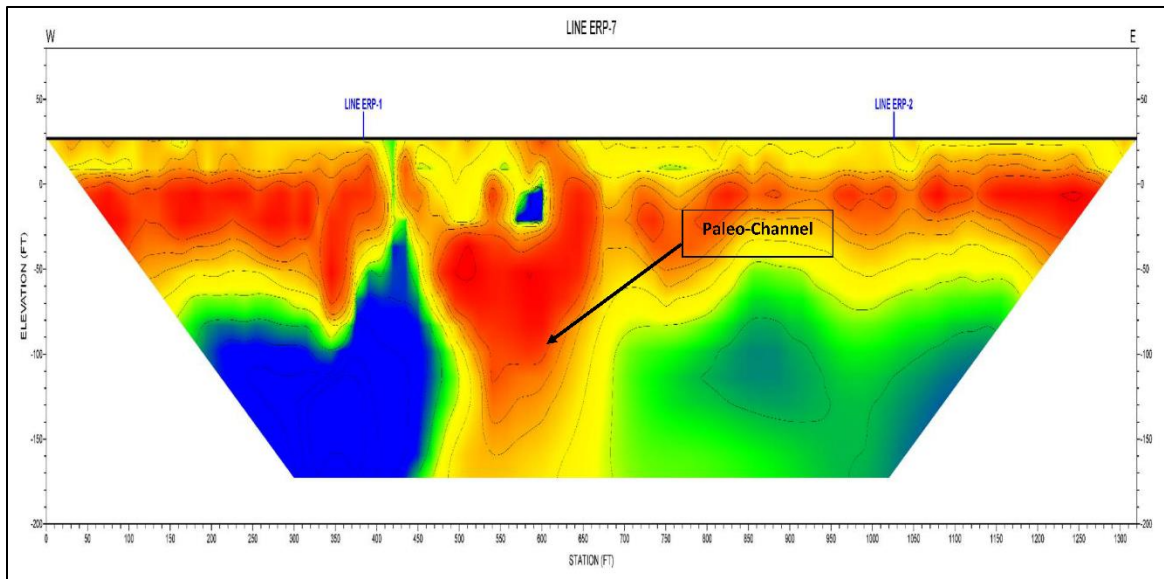

### Geology and Hydrogeology

As part of the project, the identification of both geologic and hydrogeologic units is critical to the overall understanding of how groundwater flows through the environment. Identification of **geologic formations**, such as the Laguna Formation, should be based on explicit practices for classifying and naming all formally defined geologic units as presented in the North American Stratigraphic Code (North American Commission on Stratigraphic Nomenclature (NACSM, 2005).

The formation (always capitalized when used for geologic unit, i.e. Laguna Formation) is the fundamental unit in lithostratigraphic (layers of rock in the ground) classification. As defined by the NACSM (2005), “a formation is a body of rock identified by lithic (rock or stone) characteristics and stratigraphic position; it is prevailingly but not necessarily tabular and is mappable at the Earth’s surface or traceable in the subsurface.” The key portion of this definition for the project is mappable, or easily identified, at the Earth’s surface or traceable in the subsurface. For this project, characteristics easily identifiable in drill cuttings (material produced from the ground when drilling a well) were critical to the identification of geologic formation boundaries. For example, if encountered, the Mehrten Formation would be distinguished from the overlying Laguna Formation in **drill cuttings** collected from soil borings following the criteria of Blair and others (1991) whereby the significant presence (greater than 50 percent) of volcanic rock types referred to as andesite, andesitic basalt, and/or dacite are present. In contrast, the numerous Quaternary formations used by others in the area are based on geomorphic or buried-soil information rather than on criteria by which formal formations are distinguished. More importantly, the criteria used by others cannot be easily distinguished in drill cuttings. For this project, these units were defined to include all post-Mehrten sediments in the area and were designated as the Laguna Formation.

The Laguna Formation consists of **fluvial** deposits, or deposits formed from the processes of rivers and streams. The term **distal** refers to areas farthest away from the source of rock material making up the sediments as opposed to **proximal** that indicates portions of the geologic formation nearest the source of rock material. Characteristic of former river systems is the deposition of interbedded sands, gravels, silts and clays whereby the sand and gravel units represent material deposited within the high velocity flows of the main river channels and the silts and clays represent material deposited within areas of low velocity flows such as the floodplains. This type of depositional environment forms subsurface features referred to as “**paleo-channels**” that represent areas of former river cuts that have been filled in with coarse grained sediments. An example of this type of feature was interpreted for electrical resistivity profile (ERP) number 7 (Figure G-1) conducted

as part of this project (see discussion below for technical terms used for ERP survey). As seen on this figure, the paleo-channel is represented by the thick sequence of red and yellow colors that represent sand and gravel deposits that are juxtaposed against the less permeable material of the silts and clays. As discussed within this report, identification of these types of features are critical to the overall understanding of groundwater movement within the system.

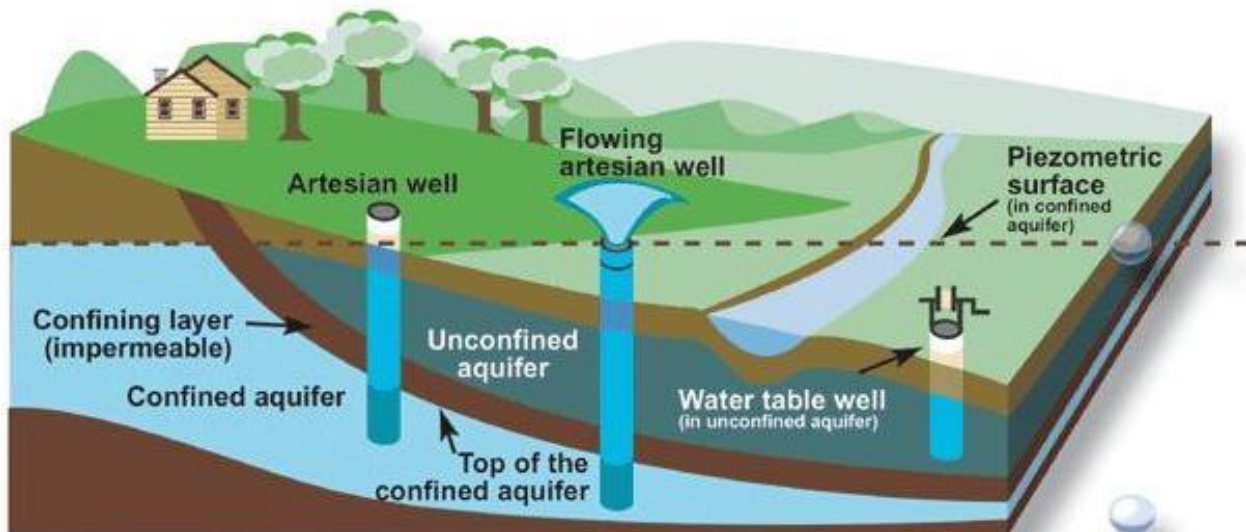

**Figure G-1. ERP 7 showing paleo-channel feature where red and yellow colors are thickest. These zones represent sands and gravels deposited in former river channel that cut down through juxtaposed silts and clays (blue and green areas). Below provides a discussion of the technical terms used for the ERP survey.**

**Hydrogeologic**, or **hydrostratigraphic**, units are designated based on **permeability** (ability to transmit water) of the sediment. More permeable consist of sands and gravels and low permeable units consist of silts and clays. For this project, an intermediate permeably unit is also defined consisting of silty sands. An **aquifer** is defined as an underground layer of water-bearing permeable rock or unconsolidated materials (gravel, sand, or silt) from which groundwater can be extracted using a water well. An aquitard represents the low permeable material (silts and clays) that restricts the flow of water.

Aquifers can be either **unconfined** or **confined**. In unconfined aquifers, the ground water only partially fills the aquifer and the upper surface of the ground water (**the water table**) is free to rise and decline. The ground water is at atmospheric pressure. The height of the water table will be the same as the water level measured in a well completed in the unconfined aquifer. A confined aquifer is sandwiched between aquitards, or **confining beds**, that impede the movement of water into and out of the aquifer. Because of the confining beds, ground water in these aquifers is under pressure. Because of the pressure, the water level in a well will rise to a level higher than the water level at the top of the aquifer. The water level in the well is referred to as the **potentiometric surface** or **pressure surface**. In some instances, the potentiometric surface may be above the surface of the ground, in which case the well is called a **flowing artesian well**, where water will flow out of the well to the ground surface naturally. Figure G-2 below illustrates the concepts of confined and

unconfined aquifers discussed above. An aquifer partially confined by aquitards is referred to as a **semi-confined aquifer**. In semi-confined aquifers, the water level in a well will still rise to a level higher than the water level at the top of the aquifer. A **leaky confined** aquifer indicates that the aquitards slowly give up water to the aquifer, providing additional water that reduces drawdown during pumping. As discussed in this report, the presence of leaky confined aquifers is important to the overall understanding of how recharge water will move through the system.

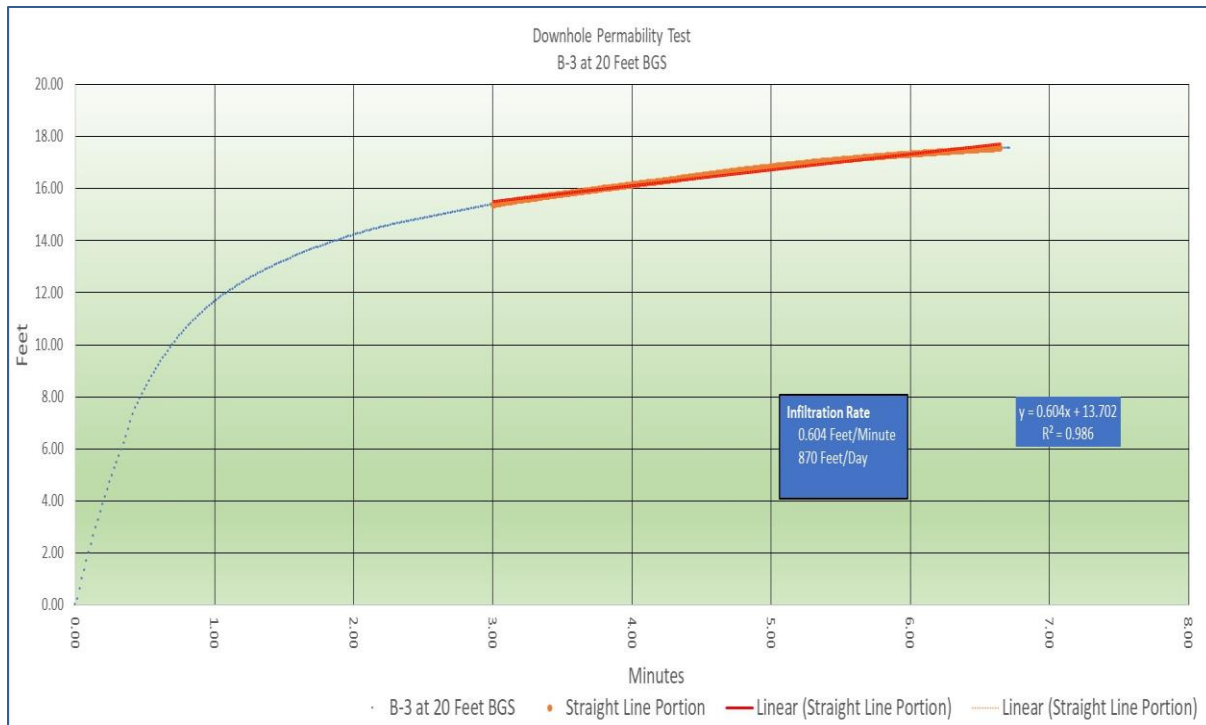

**Figure G-2. Schematic drawing showing concept of confined and unconfined aquifer systems.**

## Recharge and Infiltration

One of the primary objectives of the project is to assess recharge mechanisms to the aquifer. **Groundwater recharge** is a hydrologic process where water moves downward from surface water to groundwater. This process usually occurs in the vadose zone below plant roots and is often expressed as a flux to the water table surface. Recharge occurs both naturally (through the water cycle) and through anthropogenic processes (i.e., "artificial groundwater recharge"), where rainwater and or reclaimed water is routed to the subsurface. Recharge to deeper confined aquifers can also occur from overlying aquifers through a **leaky confining unit** (defined above).

One of the methods used for the project to assess the ability of surface soils to transmit water downward was soil **infiltration** testing. Soil infiltration testing is a measure of the rate at which soil is able to absorb water. Soil infiltration testing allows an assessment of water infiltration capacity of the sediments encountered at the Site. Three methods were used to provide these methods, **cone penetrometer testing** (discussed below), laboratory testing, and **downhole permeability testing**. Laboratory testing was conducted using American Standard Test Method (ASTM) D5084 Method C and the reader is referred to the ASTM publication for a more detailed discussion. Downhole permeability testing is conducted by inserting a solid casing to the desired depth to be tested that can be filled with water that can only move through the underlying soils below the bottom of the casing. For this project, **falling head tests** were conducted whereby a slug of water is placed in the casing and water levels measured overtime are recorded. The **infiltration rate** is calculated by the slope of the straight-line portion of the curve from these measurements as

shown on Figure G-3. Infiltration rate is defined as the volume flux of water flowing into the profile per unit of soil surface water expressed in height (e.g. feet) per time (e.g. day). For example, and infiltration rate of 1 foot per day over a 1-acre area would allow 1 acre-foot of water to infiltrate below the surface measured over a 1-day period. One acre-foot is equal to about 325,852 gallons. Table G-1 provides typical infiltration rates for soil types.

**Figure G-3. Changes in water level measured during downhole falling head permeability test. Infiltration rate is estimated from the slope of the straight-line portion of curve shown in red on the figure. The equation of the slope is  $y = mx + b$  where  $m$  is the slope in units of the vertical axis (feet) over the horizontal axis (minutes).**

**Table G-1. Average infiltration rates for typical soils from California Transportation Department (Caltrans, 2020).**

NRCS Soil Type	USCS Classifications	Typical Infiltration Rate (Feet/Day)
Sand	SP, SW, or SM	16
Loamy Sand	SM, ML	4
Sandy Loam	SM, SC	2
Loam	ML, CL	0.6
Silt Loam and Silt	ML, CL	0.5
Sandy Clay Loam	CL, CH, ML, MH	0.3
Clay Loam, Silty Clay Loam, Sandy Clay, and Silty Clay	CL, CH, ML, MH	Less than 0.01
Clay	CLM CH, MH	Less than 0.01

## Cone Penetrometer Tests

The cone penetration or **cone penetrometer test** (CPT) is a method used to determine the geotechnical engineering properties of soils and delineating soil stratigraphy. The test method consists of pushing an instrumented cone, with the tip facing down, into the ground at a controlled rate (controlled between 1.5 -2.5 cm/s accepted). A detailed discussion of this method including terms used in this report is provided in the CPT report provided in Appendix B.

## Electrical Resistivity Profile

**Electrical resistivity profiling** (ERP) measures subsurface electrical properties related to lithologic variations. The apparent resistivity of subsurface material is determined by transmitting electrical current into the ground through metal electrodes placed along a traverse and measuring the resulting voltage. **Electrical resistivity** (ER) is defined as the resistance of a volume of material to the flow of electricity,” and is the inverse of conductivity. The method measures and quantifies ER values within earth materials. These values are presented as a two-dimensional (2-D) image (Figure G-1), or profile, of the subsurface ER structure. The measured ER values are presented in units of ohm-meters ( $\Omega$ -m).

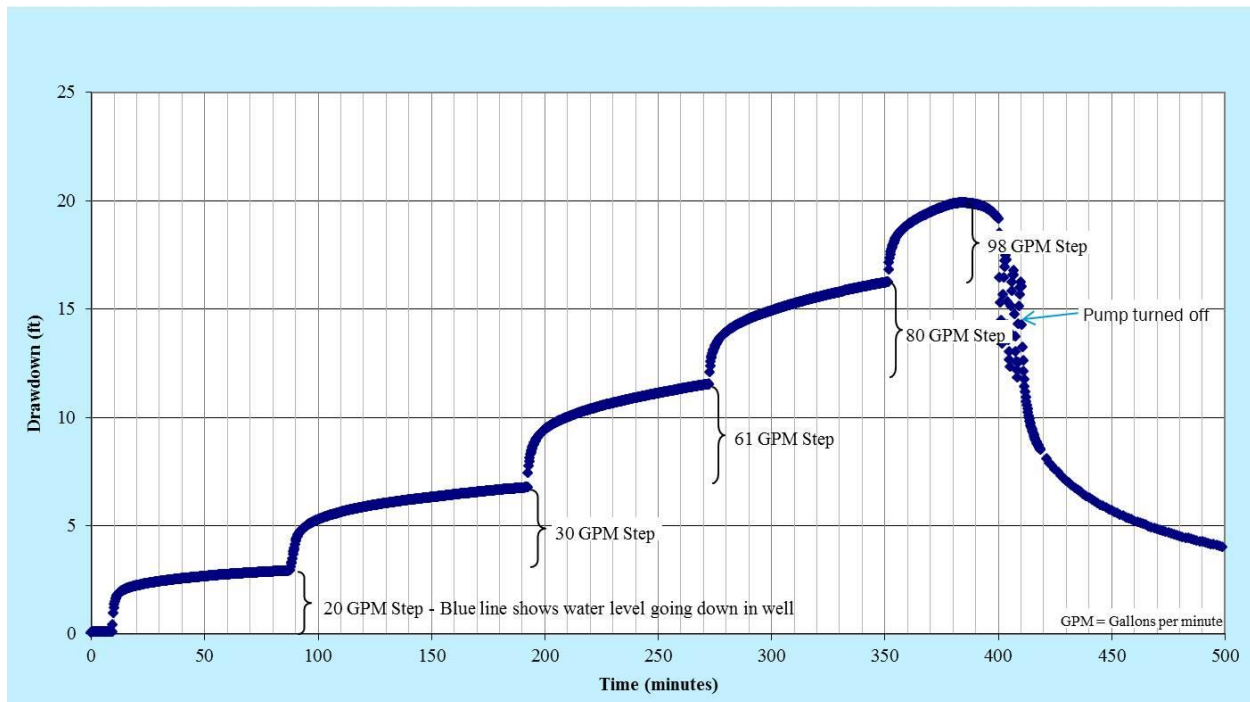

ER values within rock are typically higher than in sediments, primarily due to lower moisture content within the rock. Within fresh-water sedimentary deposits, moisture content and grain size tend to control ER values. Higher fine-grained fractions and higher moisture content within earth materials produce lower ER values, which is to say that they are more electrically conductive. Conversely, coarse-grained materials such as sand and gravel produce higher ER values and typically exhibit an increase in permeability. A detailed discussion of the ER survey including terms uses is presented in the Task 3 Technical Memorandum for the project provided in Appendix A.

## Aquifer Testing

An **aquifer test** is a field test where a well is pumped at a known and controlled rate and water-level response, or **drawdown**, is measured within the pumping well and one or more surrounding observation wells. Two types of aquifer tests are common and were conducted as part the project, **step drawdown aquifer tests** and **constant rate aquifer tests**.

A step drawdown aquifer test is a single-well pumping test designed to investigate the performance of a pumping well under controlled variable discharge conditions. In a step drawdown test, the discharge rate, or pumping rate, in the pumping well is increased from an initially low constant rate through a sequence of pumping intervals (steps) of progressively higher constant rates. Each step is typically of equal duration, lasting from approximately 30 minutes to 2 hours. Figure G-4 shows a typical drawdown plot produced for a step drawdown aquifer test. The primary objective of a step drawdown aquifer test is to evaluate well performance criteria such as **well loss** and **well efficiency** that can be used to select an appropriate pumping rate for a constant rate aquifer test. Well loss is head loss, or drawdown of water level, caused by flow through a screen and inside a well. Well efficiency is defined as the ratio of the theoretical drawdown in the formation to the actual drawdown in the well. The difference between the two is caused by frictional energy losses of the water as it moves from within the formation to the pump intake. Thus, well efficiency describes the effectiveness of a well in yielding water. Step drawdown tests are also used to

calculate the **specific capacity** of a well. Specific capacity is simply the pumping rate (usually reported as gallons per minute) divided by the drawdown (usually reported in feet). It is a very valuable number that can be used to provide the design pumping rate or maximum yield for the well. It can be used to identify potential well, pump, or aquifer problems, and accordingly to develop a proper well maintenance schedule. The data from a step drawdown aquifer test can also be used to provide preliminary estimates of hydraulic properties of an aquifer system such as transmissivity and hydraulic conductivity.

**Figure G-4. Typical drawdown curve produced for step drawdown test.**

The goal of a **constant rate aquifer test** is to estimate hydraulic properties of an aquifer system. A constant rate aquifer test consists of pumping a well at a single rate for a long enough duration to see drawdown responses (decline in water levels) from one or more observation wells. For the pumped aquifer, one seeks to determine **hydraulic conductivity**, **transmissivity**, and **storativity**. Hydraulic conductivity, represented in this report with a “K”, describes the ease with which water can move through pore spaces or fractures. Average K values for unconsolidated sedimentary materials are provided on Table G-2.

**Table G-2. Hydraulic conductivity values of common aquifer materials. Modified from Bear (1972)**

	K values in units of feet per day (ft/day)										
	100,000	10,000	1,000	100	10	1	0.1	0.01	0.001	0.0001	0.00001
<b>Aquifer Quality</b>	<b>Good</b>					<b>Poor</b>					<b>None</b>
Typical Aquifer Material	Well Sorted Gravel		Well Sorted Sand or Sand and Gravel			Very Fine Sand				Clay	

**Transmissivity**, represented by a “T” in this report, is a measure of the ability of an aquifer to produce water and is equal to K times the thickness of the aquifer (represented with a “b” in this report), or  $T = Kb$ . As such, a T value for a 10-foot thick well sorted sand with a K value of 100 would be the same as a 100 foot thick fine sand with a K value 10. Within the permeable materials shown on Figure G-1, although the K values are the same across these units within the same aquifer, the T value within the paleo-valley is much greater than the units outside of the paleo-valley. Units of T are feet squared per day (ft<sup>2</sup>/day). Typically, T values of less than 100 ft<sup>2</sup>/day will supply only enough water for domestic wells or other low-yield purposes. In wells with T values greater than 1,300 ft<sup>2</sup>/day, the production yields are typically sufficient for industrial, municipal, or irrigation use.

**Storativity**, represented by an “S” in this report, is a physical property that characterizes the capacity of an aquifer to release groundwater. Specifically, it is defined as the volume of water an aquifer releases from or takes into storage, per unit surface area per change in head and is a unitless number. The storativity of a confined aquifer typically ranges from 0.00005 to 0.005 (Todd 1980) whereas for unconfined aquifers, storativity ranges from 0.1 to 0.3 (Todd, 1980).

For this project, aquifer properties were estimated from the constant-rate aquifer test by fitting mathematical models to drawdown data through a procedure known as **curve matching**. Curve matching may be performed using type-curve methods (curves produced by solving the mathematical equation for a particular solution), on log-log plots, or straight-line methods on semi-log plots. To allow for a more detailed analysis of the curve matching process, the software package AQTESOLV™ was used to analyze the drawdown data collected for the project.

## Groundwater Quality

Groundwater and surface water samples were also submitted for analysis of common **ionic compounds**. Ionic compounds are basically defined as being compounds where two or more ions are held next to each other by electrical attraction. One of the ions has a positive charge (called a "**cation**") and the other has a negative charge ("**anion**"). The cations are the metal atoms including calcium and sodium and anions are the nonmetals including chloride and sulfate.

For this project, these compounds were plotted on a **Piper Diagram**. A Piper diagram is a graphical representation of the chemistry of a water sample or samples. Piper diagrams are a combination cation triangle (lower left) and anion triangle (lower right) that lie on a common baseline (see Figure G-5). A diamond shape is placed between them. Information that can be assessed from this diagram includes water type, mixing of waters, and potential precipitation or solution (dissolving) of minerals. A more detailed discussion of the use and interpretation of Piper diagrams are presented in Section 4.3.

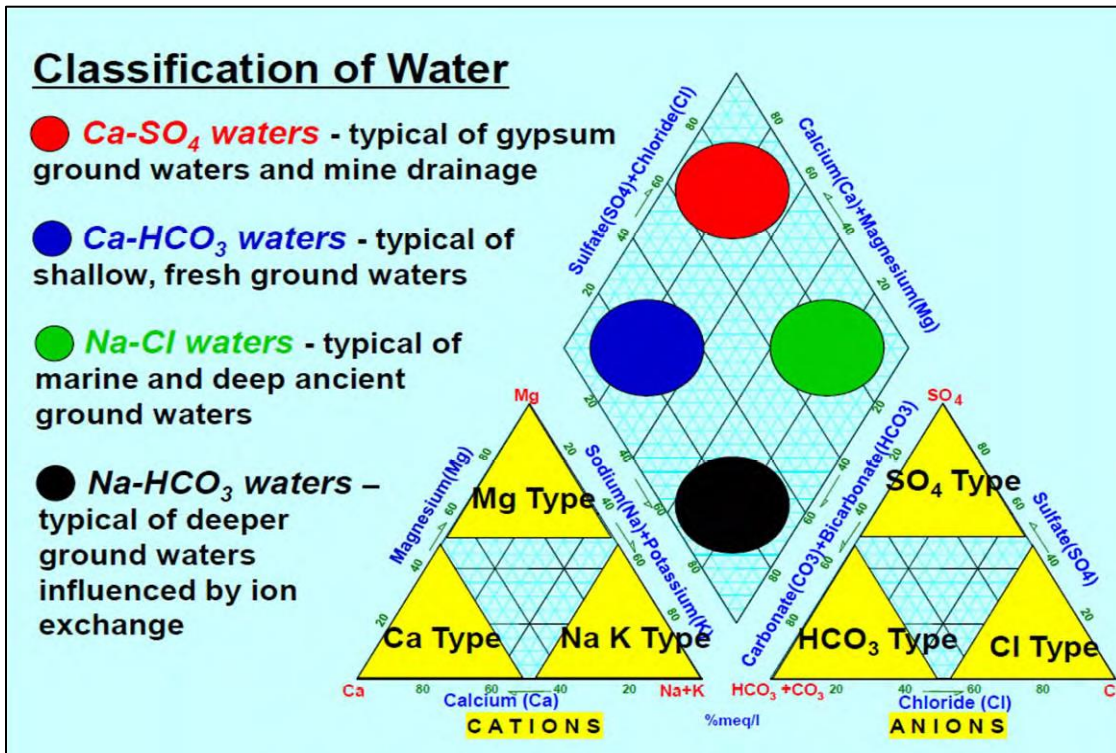

Figure G 5. Outline of Piper Diagram Showing Water Classifications Developed for Cation and Anion Analysis.

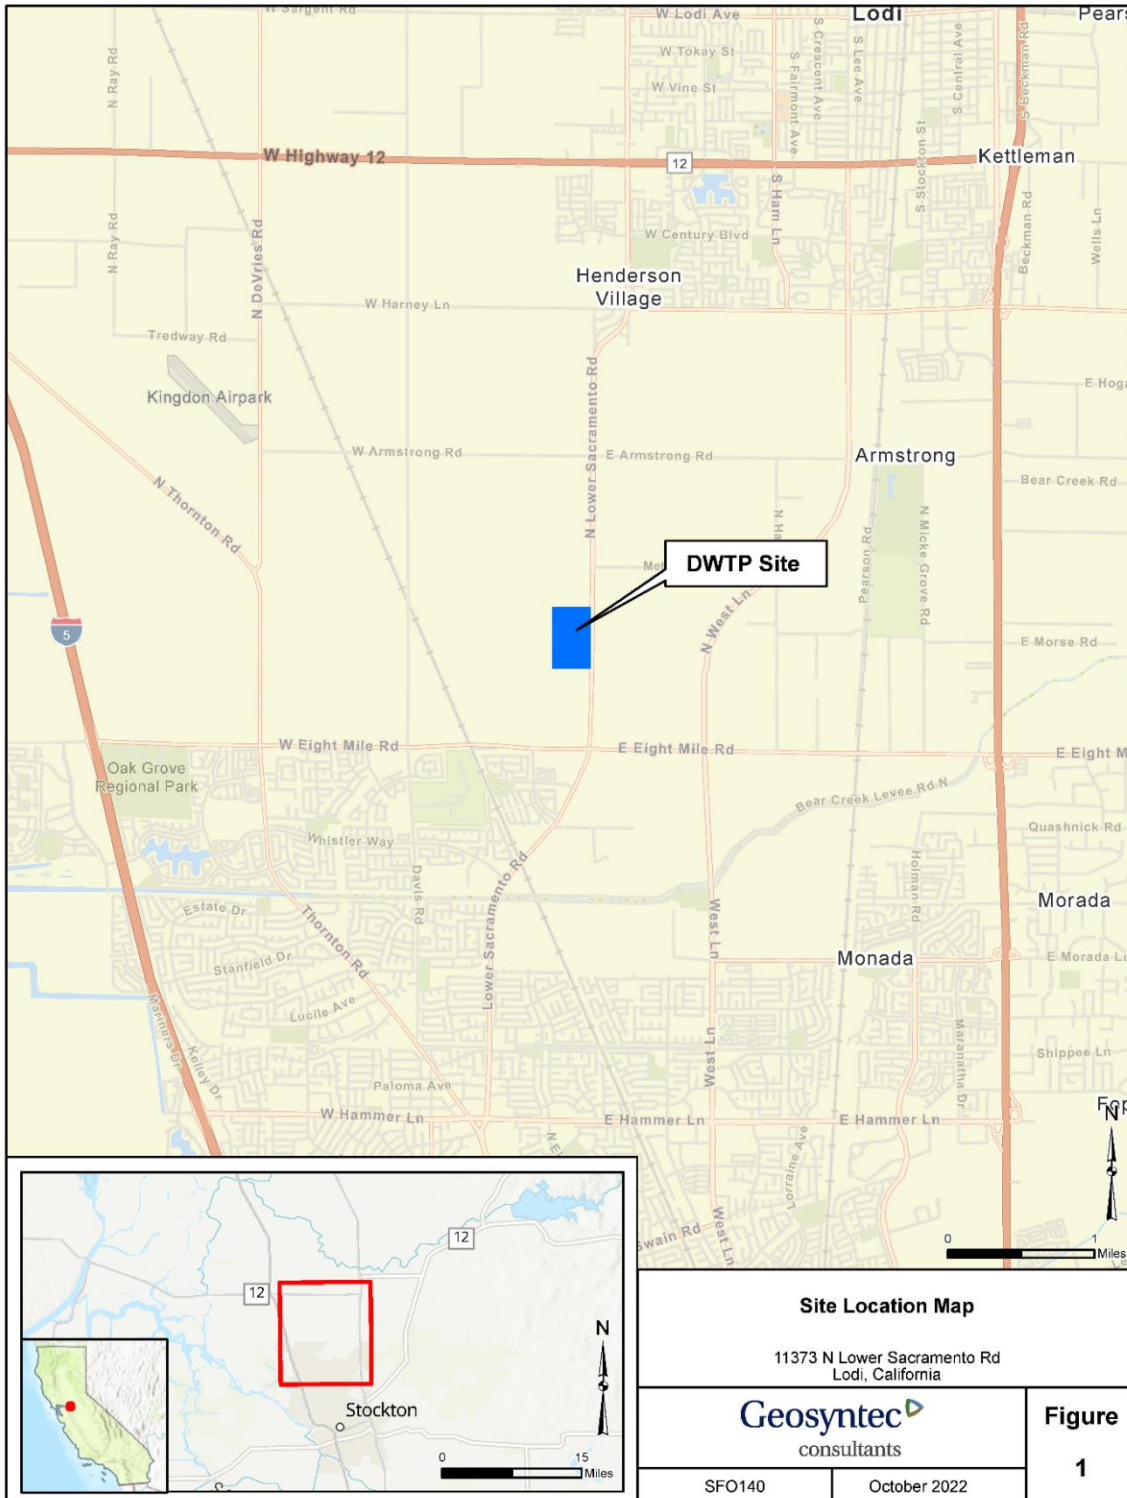

## 1. INTRODUCTION

This report presents the feasibility study for the City of Stockton's (City) Delta Water Treatment Plant (DWTP) groundwater recharge improvement project. This work is being conducted in accordance with the City Agreement Number 422000858 between the City and Geosyntec Consultants, Inc. (Geosyntec) dated July 1, 2022, and amended on April 11, 2023.

### 1.1 Overview

The DWTP is located along Lower Sacramento Road, north of Eight Mile Road, between the City of Stockton and the City of Lodi (Figure 1). During the design phase of the DWTP, the City of Stockton Municipal Utility District (MUD) commissioned the design-build team to conduct a preliminary groundwater recharge feasibility study of the approximate 70-acre site adjacent to the DWTP (Figure 2). This draft study, completed in 2009 (CDM Smith 2009), concluded that with water from the Woodbridge Irrigation District (WID) and possibly City of Lodi stormwater flows, a direct groundwater recharge and recovery project was feasible. The study recommended additional engineering feasibility and design studies to confirm water availability, recharge infiltration rates, and storage capabilities.

The City (via Agreement Number 422000858) commissioned Geosyntec to conduct these additional assessments, including nine tasks. Tasks 1 and 2 included literature searches for regional and site-specific existing information, respectively. Task 2 also included the development of a geographic information system (GIS)-based topographic survey of the site and assessment of existing utilities. Task 3 included completion of an electrical resistivity profiling (ERP) survey of the proposed recharge area to provide an initial assessment of the underlying lithology. Tasks 4 and 5 were preparation of the draft and final work plan that outlined the procedures and methods used to perform the field investigations completed for the project. Task 6 included obtaining necessary permits for the approved field investigations, and Task 7 was the approved field investigation that included completion of cone penetrometer tests (CPT), soil borings, drilling and installation of groundwater wells, infiltration testing, aquifer testing, and laboratory testing of soil and water. Task 8 included the hydrogeologic characterization of the site using the information developed from the ERP survey and the field investigations from Task 7. Task 9 is preparation of this Feasibility Study Report, which provides an assessment of the suitability to recharge surface-applied water to the site. This Feasibility Study Report also presents the results of the hydrogeologic characterization. Task 9 also included preparation of the preliminary design for proposed recharge facility and estimate of probable costs. These portions of Task 9 are presented as a separate report submitted concurrently with this FS Report.

P:\GIS\SFO140\_DWTP\_GroundwaterRecharge\DWTP\_GroundwaterRecharge.aprx\Site Location Map 9/1/2022

**Figure 1. Site Location Map**

## 1.2 Purpose and Objectives

The purpose of the DWTP groundwater recharge improvement project is to evaluate the potential for groundwater recharge at the site and to develop a feasibility study and preliminary design report. The purpose of the hydrogeologic characterization is to characterize the hydrogeology at and around the vicinity of the DWTP using data collected from Tasks 1 through 3 and Task 7. Specific information related to hydrogeologic characterization and summarized in this report includes the following:

- Estimation of infiltration rates and migration pathways for applied recharge water
- Storativity of the upper groundwater aquifer
- Hydraulic conductivity of the upper groundwater aquifer
- Available storage for applied recharge water
- Potential recovery well production rates
- Groundwater flow directions
- Existing groundwater quality
- Potential chemical interactions between source water, soils, and groundwater.

This report also includes a summary of the field activities conducted as part of Task 7, including changes to program as outlined in the final work plan (Geosyntec 2022a) and the results of infiltration testing, aquifer testing, and physical and chemical testing of soil and groundwater samples.

## 1.3 Report Organization

The organization of this report has been developed to follow specific objectives of the hydrogeologic characterization as discussed in Section 1.2 followed by the feasibility analysis. Section 2 summarizes the methods and procedures completed for the field program as part of Task 7, including changes to the field program that were outlined in the final work plan. Section 3 summarizes the results of the field program, including infiltration testing, aquifer testing, and physical and chemical testing of soil and groundwater samples. Section 4 summarizes the hydrogeology in the vicinity of the DWTP and provides an update to the hydrogeologic conceptual model (HCM) presented in the final work plan based on the results of the Task 7 field investigation. Section 5 presents the feasibility analysis for groundwater recharge operations at the site. References are provided in Section 6.

Figure 2. Site Plan

## 2. FIELD METHODS AND PROCEDURES

This section summarizes the methods and procedures used to conduct the field activities as part of Task 7 for the project. Field activities included the following:

- Field setup and coordination
- Completion of CPT points
- Drilling, sampling, and downhole permeability testing of soil borings
- Drilling, development, and installation of monitoring well and test well
- Aquifer testing
- Physical and chemical testing of soil samples and water samples

A detailed description of the methods and procedures and changes to the program as outlined in the approved final work plan (Geosyntec 2022a) is provided in the following sections. All field activities described in this section were conducted under the oversight of a Geosyntec geologist certified as a California-licensed Professional Geologist.

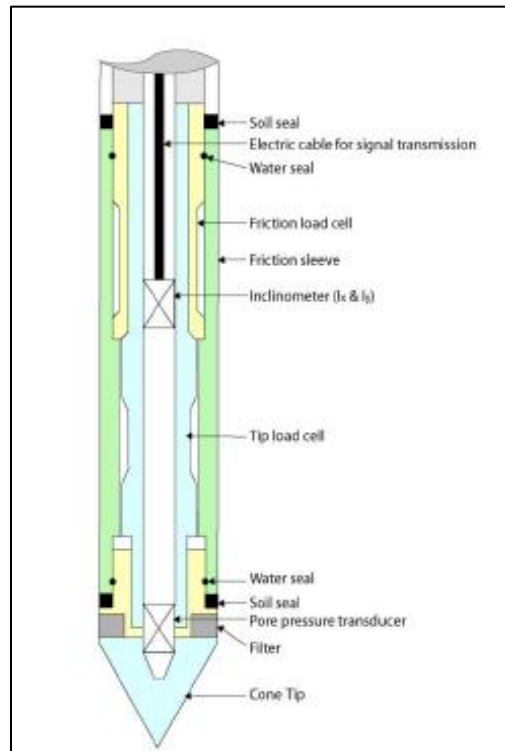

Field activities also included completion of an ERP survey conducted as part of Task 3 for the project. The methods and procedures for this task were presented in the Task 3 Technical Memorandum (Geosyntec 2022b) and the results were summarized in the final work plan (Geosyntec 2022a). A copy of the Task 3 Technical Memorandum is provided as Appendix A.

### 2.1 Field Setup and Coordination

Field setup and coordination included obtaining drilling permits from the San Joaquin County Environmental Health Department and contacting Underground Service Alert (USA) for clearance of underground utilities. Drilling permits were obtained for both the soil boring program and installation of monitoring well and test well. The permit numbers are WP0043836, WP0044045, WP0044126 and WP0044127. Copies of these permits are provided in Appendix B. The USA ticket numbers for this project are X228301746-00X, X234900843-00X, and 2023012001337-000.

### 2.2 CPT Program

The CPT technology was used to further evaluate soil lithology and geotechnical soil properties at the site. The CPT method involves hydraulically pushing a cone penetrometer into the ground and recording the resistance. Figure 3 shows a diagram of the CPT instrument. Based on published correlations, the data obtained are used to estimate stratigraphy, soil type, groundwater depth, and in situ parameters. The CPT data can also be used to estimate hydraulic conductivities. All CPT soundings are performed in accordance with revised ASTM International standards (D 5778-12).

**Figure 3. Illustration of the CPT Instrument (see Appendix B)**

The CPT survey was conducted from October 17 to October 19, 2022, by Gregg Drilling of Martinez, California (Gregg Drilling), a C-57 licensed driller (Photograph 1). A copy of the Gregg Drilling CPT report is provided in Appendix B.

**Photograph 1. Gregg Drilling CPT Rig at CPT-1 Location**

Figure 4 provides an example of the primary CPT plot provided by Gregg Drilling that includes soil type and depth to first water. The results of the CPT survey are discussed in Section 4 as part of the update to the HCM. Figure 5 provides a graph illustrating the estimated saturated infiltration rates that are also produced from the CPT survey using normalized interpretative soil behavior types (SBTn). The results of these permeability estimates are discussed in Section 3.1.

Five CPT borings, designated CPT-1 through CPT-5, were completed at the approximate locations shown on Figure 5. As indicated in the final work plan (Geosyntec 2022a), the anticipated depth of the CPT points were 90 feet below ground surface (bgs). However, a primary objective of the field program was to identify the upper permeable groundwater aquifer and potential migration pathways from the surface to this unit. This unit was not observed in the initial CPT boring (CPT-1), and subsequent CPT borings were drilled to varying depths ranging from 90 feet bgs to 112 feet bgs as summarized below.

**Table 1. Summary of CPT Points**

<b>CPT Point</b>	<b>Date Completed</b>	<b>Total Depth (feet bgs)</b>	<b>Static Water Level (feet bgs)</b>	<b>Water Sample Depth (feet bgs)</b>	<b>Latitude</b>	<b>Longitude</b>

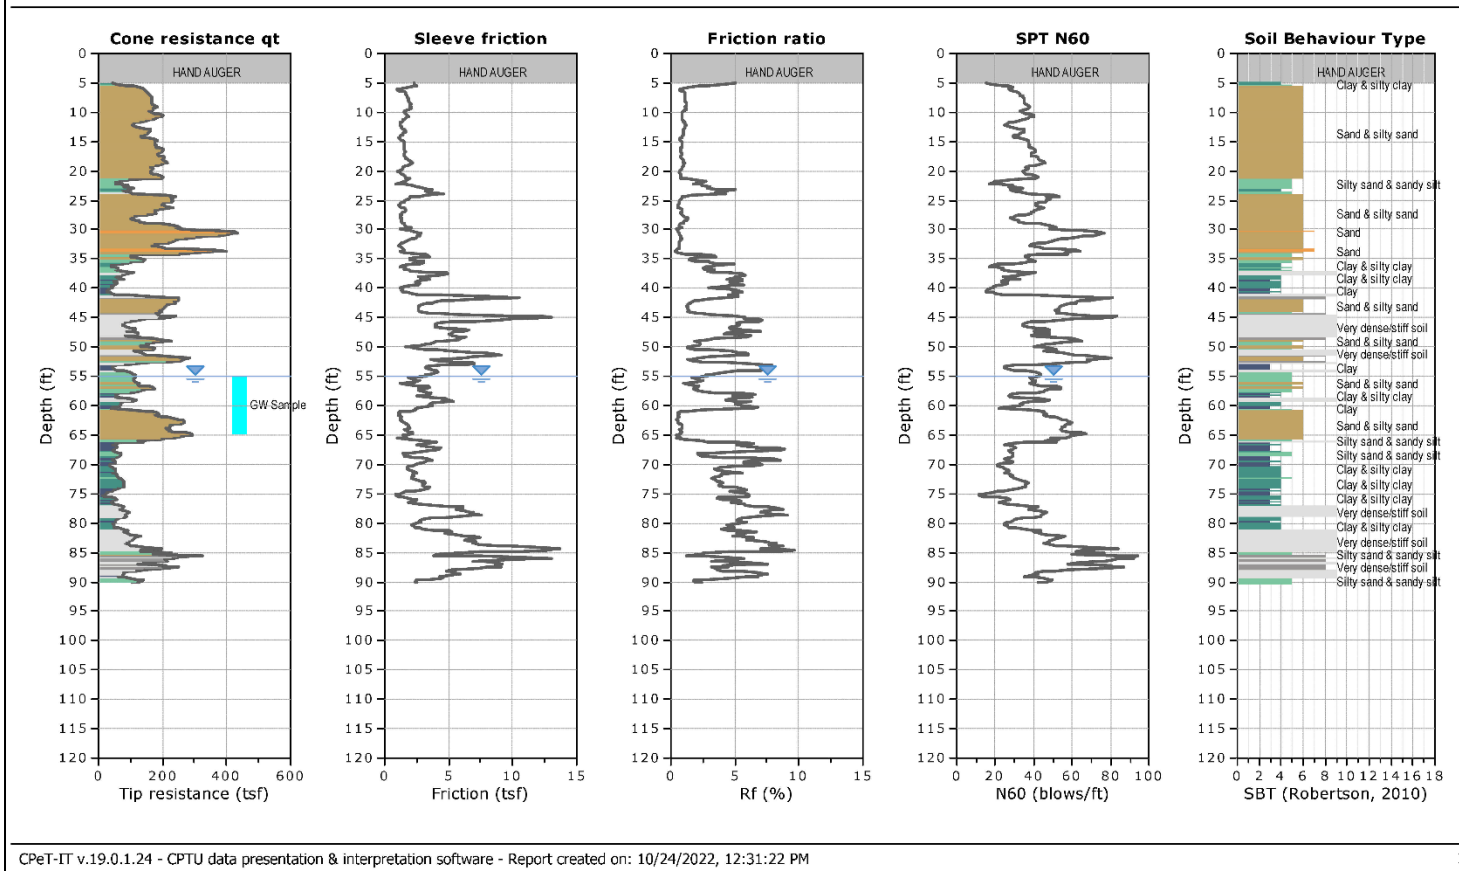

Figure 4. Example of CPT Plot Showing Lithology Types and Depth to First Water (see Appendix B)

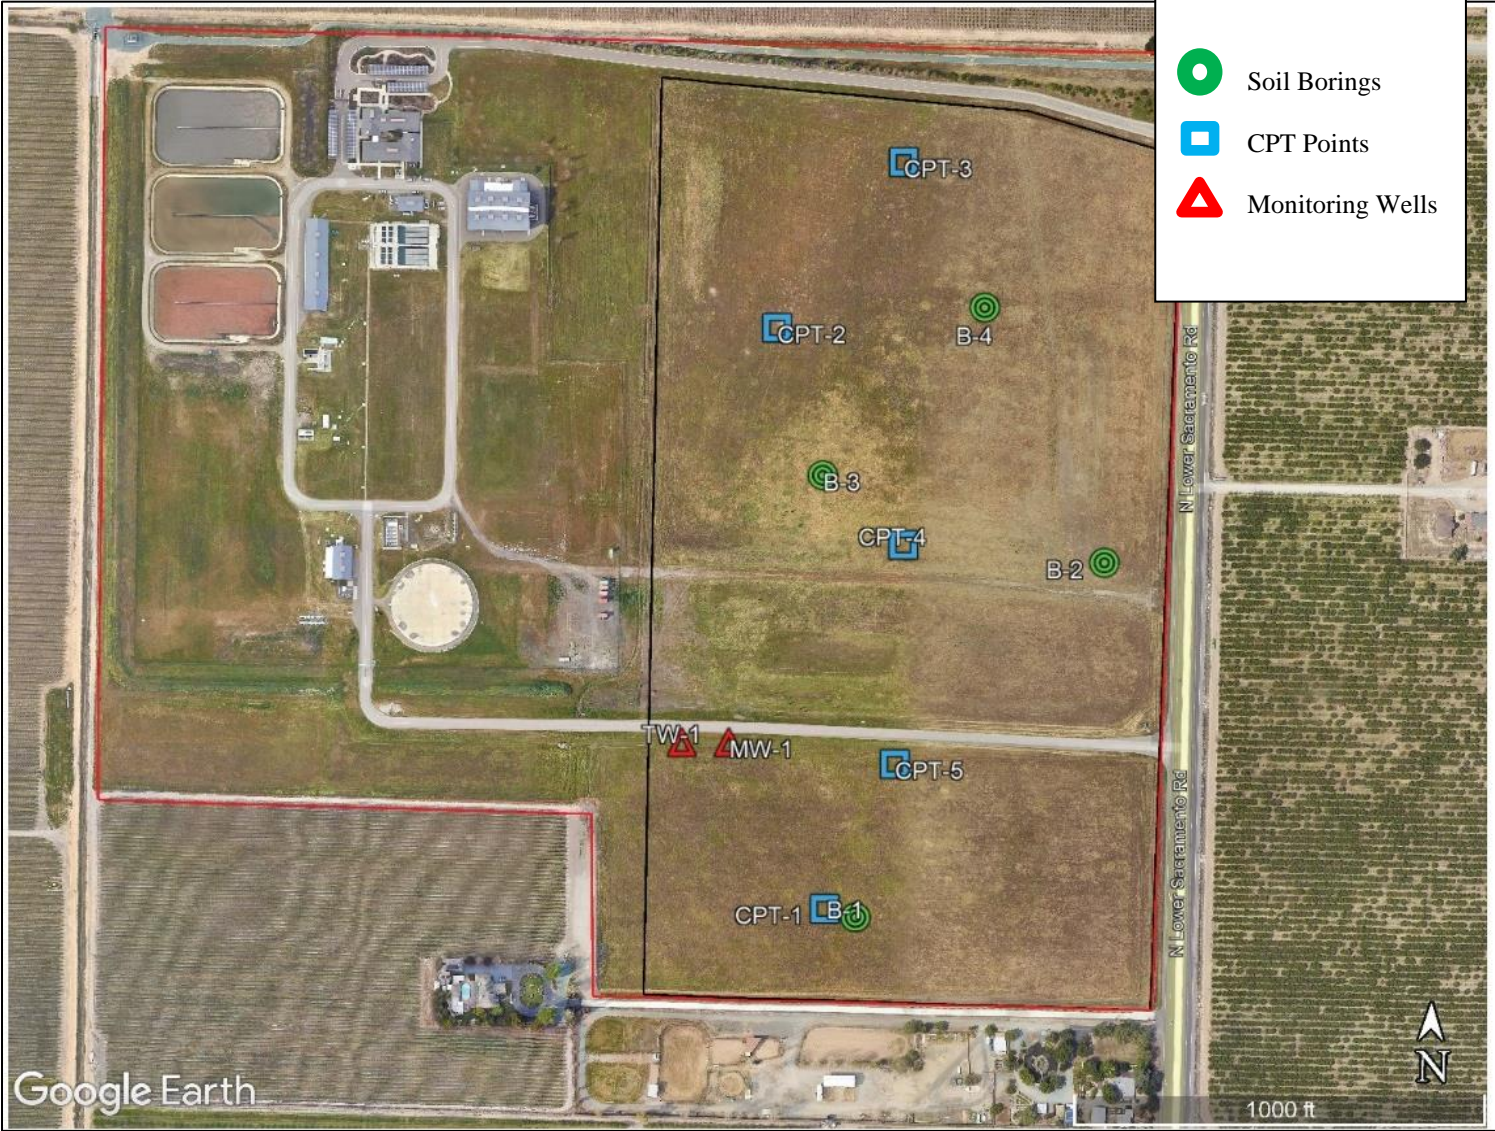

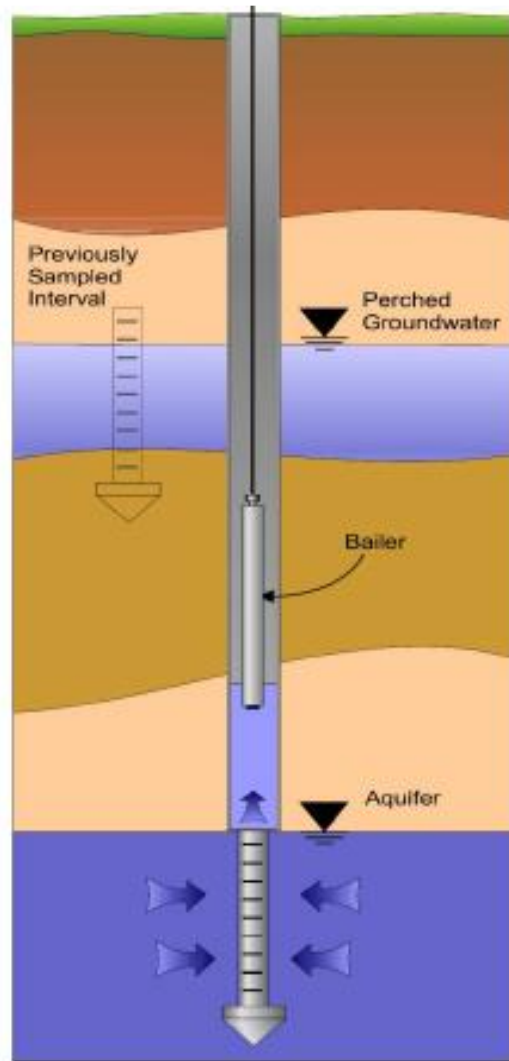

Figure 5. Location of CPT Points, Soil Borings, and Wells

At each CPT point, pore-pressure dissipation tests (PPDT) were conducted to assess the approximate depth of the groundwater table. Table 1 summarizes the depth these tests were conducted at each CPT point and the calculated depth to the groundwater table.

After completion of each CPT point, groundwater samples were collected using Gregg Drilling's in situ sampling device (Figure 6). The groundwater sampler operates by advancing 44.5 millimeter (mm) (1¾ inch) hollow push rods with the filter tip in a closed configuration to the base of the desired sampling interval. Once at the desired sample depth, the push rods are retracted, exposing the encased filter screen and allowing groundwater to infiltrate hydrostatically from the formation into the inlet screen. A small diameter bailer (approximately ½ or ¾ inch) is lowered through the push rods into the screen section for sample collection. Figure 6 provides an illustration of the Gregg Drilling groundwater sampler. Table 1 summarizes the depth the groundwater samples that were collected at each CPT point. Samples were collected for the analytical parameters discussed in Section 2.6. The results of the analytical testing are discussed in Section 3.3.

## **2.3 Soil Borings**

After completion of the CPT program, four soil borings, designated B-1 through B-4, were completed at the approximate locations shown on Figure 5. The borings were drilled using the sonic drilling methods by Gregg Drilling (Photograph 2). This method allows collection of continuous core samples that provide a detailed lithologic assessment at each soil boring for the presence of permeable material (Photograph 3).

**Figure 6. Schematic Drawing of Gregg Drilling In Situ Groundwater Sampler**

**Photograph 2. Sonic Drill Rig Used for Completion of Soil Borings**

**Photograph 3. Continuous Core Samples Collected During Drilling**

Photographic logs of each of the core sections are included in Appendix C. Lithology was logged by the field geologist according to the methods described in ASTM International D2488-84 and recorded continuously on a geologic boring log. Copies of the geologic boring logs are provided in Appendix C.

Discrete samples were also collected at 5-foot and 10-foot intervals. The 5-foot samples were placed in chip trays (Photograph 4) for a record of the lithologic log, and the 10-foot samples were placed in plastic bags for potential future analysis such as grain size analysis.

As discussed in the work plan, the anticipated depths for these soil borings were 90 feet bgs. However, as shown on Table 2, the total depth of soil borings ranged from 100 feet bgs (B-3) to 150 feet bgs (B-2). These depths were selected to provide information on the upper saturated permeable material, as discussed in Section 2.2. A discussion of the results of the lithologic assessment from the soil boring program is provided in Section 3.1.

**Photograph 4. Chip Tray Used to Collect 5-foot Samples for Lithologic Record**

**Table 2. Summary of Soil Borings**

<b>ID</b>	<b>Date Drilled</b>	<b>Total Depth (feet bgs)</b>	<b>Downhole Perm Test Depth (feet bgs)</b>	<b>Sample Depth (feet bgs)</b>	<b>Latitude</b>	<b>Longitude</b>

				60			

At selected locations (Table 2), drive samples were collected for physical and chemical analysis, as discussed in Section 2.6. Samples for analysis were collected in 3-inch-long stainless-steel rings (Photograph 5). For each drive sample, blow counts were recorded at 6-inch intervals (Table 2). A discussion of the results of this testing are discussed in Section 3.3.1 (physical and chemical testing).

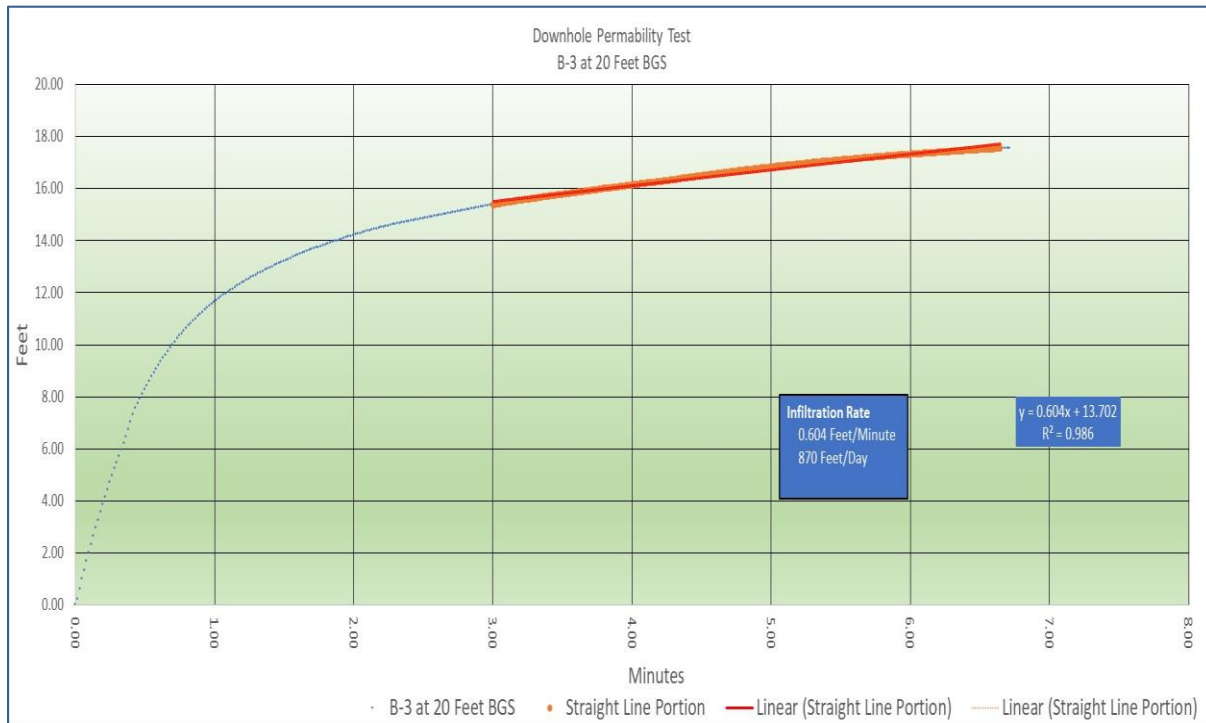

**Photograph 5. Stainless Steel Rings Used for Collection of Drive Samples**

**Photograph 6. In Situ Level Troll Pressure Transducer**

One ring from each drive sample was submitted for physical and chemical analysis, as discussed in Section 2.6.

At each soil boring location, downhole permeability tests were performed at discrete depths within the vadose zone (unsaturated zone) to provide additional assessment of infiltration rates of the different soil types observed at the site. The permeability tests were conducted by advancing the outer casing of the sonic drill stem to the desired depth. A pressure transducer was lowered down the drill stem and programmed to record water levels at 1 second intervals. An In-Situ Inc. Level Troll 700 vented transducer (Photograph 6) was used for the project. The use of vented transducers eliminates the need for a barometer and correction of data based on barometric changes. To conduct the downhole permeability test, the drill stem was filled with water, then allowed to infiltrate into the desired materials. At least 30 minutes of infiltration was allowed for each permeability test. The infiltration rates for each test are calculated from the slope of the line developed during this process, as illustrated on Figure 7. Table 2 provides the depths for the tests conducted in each soil boring, and the graphs produced for calculation of infiltration rates are presented in Appendix D. The results of these tests are discussed in Section 3.3.

**Figure 7. Downhole Permeability Plot for Test Conducted at 20 Feet in Soil Boring B-3**

The infiltration rate is calculated from the slope of the line ( $y=mx + b$ ,  $m = \text{slope}$ ) formed towards end of test as shown in the above figure (red line).

## 2.4 Well Installation

After completion of the soil boring program, two groundwater wells, designated MW-1 and TW-1, were installed at the approximate locations shown on Figure 5. Groundwater well MW-1 is a nested monitoring well (multiple well casings within the same borehole) and well TW-1 is a test well used for the aquifer testing discussed in Section 2.5. The primary purpose of these wells is to

- monitor water levels within the upper groundwater aquifer;
- allow collection of groundwater samples to assess the water quality of the upper aquifer and assess potential interactions with recharge water; and
- assess aquifer properties within the upper groundwater aquifer.

The methods and procedures used for the drilling, installation, development sampling, and aquifer testing of these wells are presented in the following sections.

### 2.4.1 Drilling of Well Boreholes and Lithologic Sampling

To install the new groundwater wells, boreholes were completed at each location using the drilling, sampling, and logging methods described for the soil boring program in Section 2.3 (Photograph 7). In addition to providing additional data on the hydrogeology of the material in this area (Figure 5), information obtained also provided the necessary data to design the triple nested monitoring well (MW-1) and test well (TW-1). The nested monitoring well was drilled first, from January 30

to January 31, 2023. During the drilling of this borehole, selected soil samples were submitted for grain size analysis for use in design of the screen material and filter pack for the test well (see Table 3 for depths). Copies of the laboratory reports for these analyses are provided in Appendix E.

**Photograph 7. Drilling on Monitoring Well Soil Boring (collection of continuous cores from sonic core barrel)**

**Table 3. Well Design Summary**

Location	Well ID	Date Completed	Total Boring Depth (feet bgs)	Total Well Depth (feet bgs)	Sample Depths (feet bgs)	Screen Interval (feet bgs)	Unit Screened
MW-1 <sup>[1]</sup>	MW-1S	01/31/2023	197	70.4	-	60-70	Shallow
	MW-1I			113.4		103-113	Intermediate
	MW-1D			160.4	146 149	140-160	Deep
TW-1	TW-1	02/03/2023	190	185.4	-	150-180	Deep

Note: <sup>[1]</sup> Wells MW-1S, MW-1I, and MW-1D were completed within same borehole.

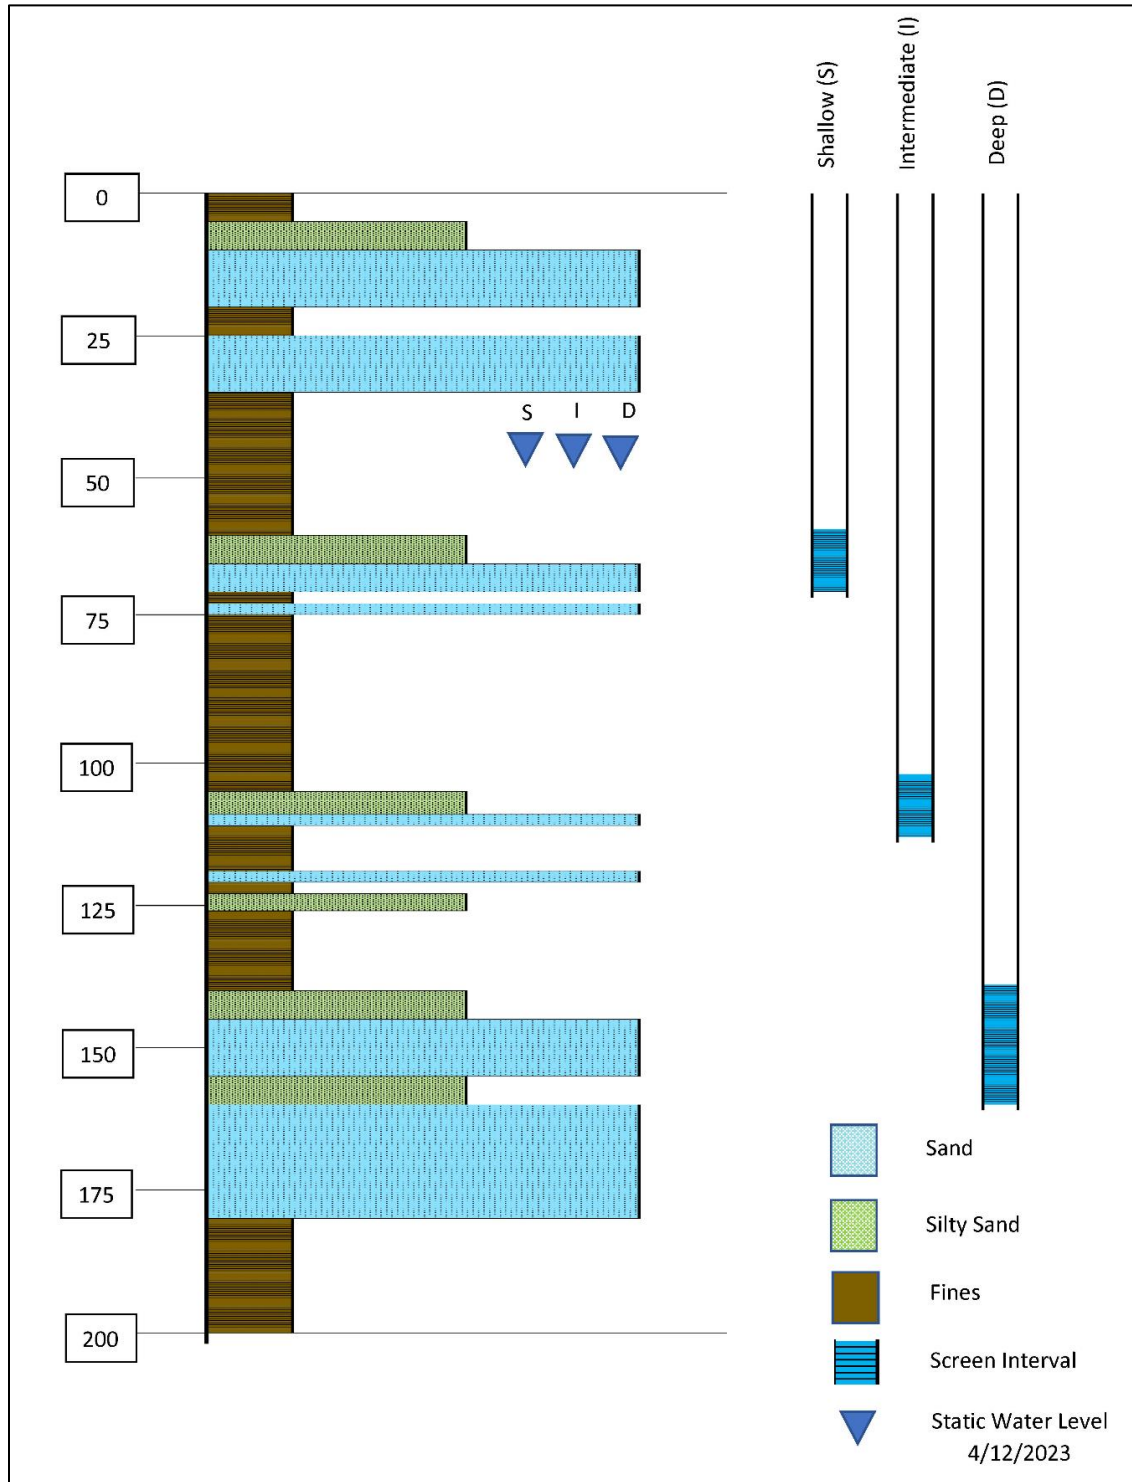

All drilling operations were conducted by Gregg Drilling from January 30 through February 2, 2023. Copies of the photographic logs and boring logs produced for these boreholes are provided in Appendix C. Copies of the California Department of Water Resources (DWR) well completion report forms completed for these wells are also provided in Appendix C.

#### 2.4.2 Well Installation and Development

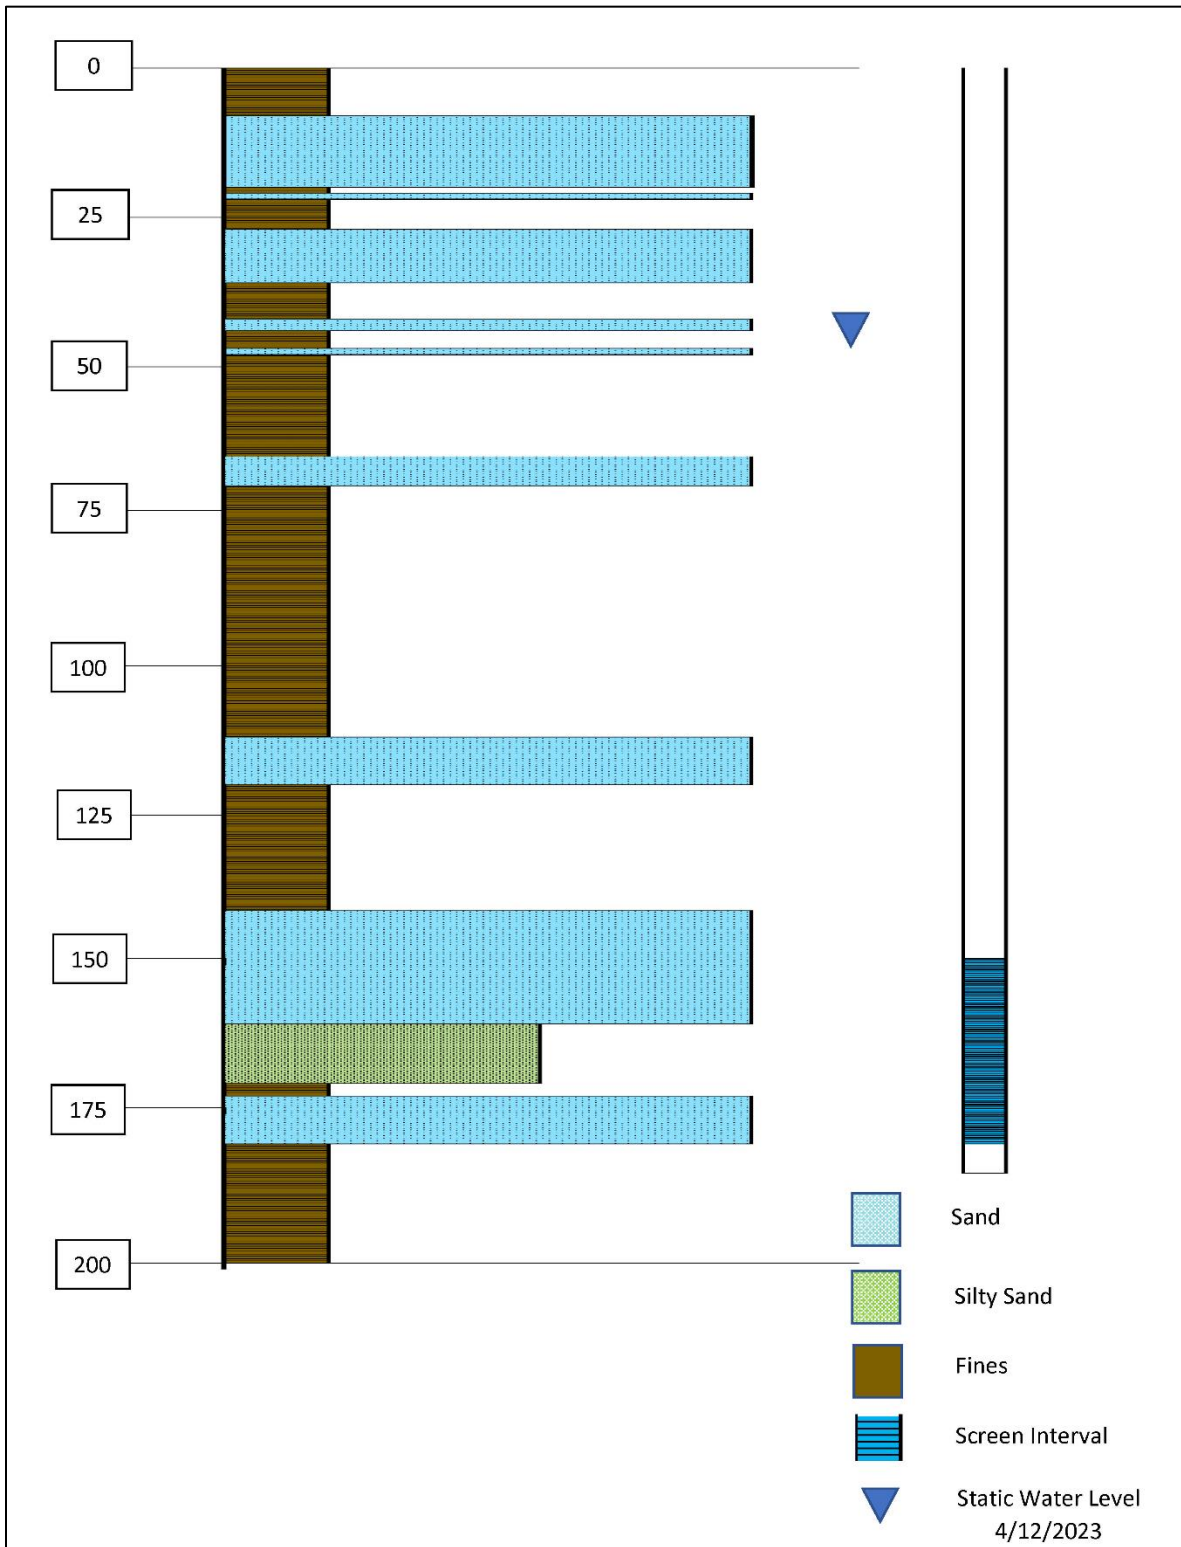

Using the information collected for the boreholes, a California Certified Hydrogeologist developed the final well design for each well including screen intervals, slot size, and gravel pack size. Table

3 summarizes the final well designs. Well completion diagrams are provided in Appendix C. Schematics of the screen intervals illustration the adjacent geologic material types are provided on the summary profiles provided in Figure 8 and Figure 9.

**Figure 8. Schematic Drawing of Nested Monitoring Well MW-1**

**Figure 9. Schematic Drawing of Nested Monitoring Well TW-1**

Well installation methods were consistent with the requirements of California Water Code Section 13801 and San Joaquin County Ordinance Code Section 9-1115. The approved well permits from San Joaquin County are provided in Appendix C. Table 4 summarizes the final well construction details.

**Table 4. Groundwater Well Construction Details**

Abbreviation: PVC - polyvinyl chloride

#### 2.4.2.1 Nested Monitoring Well MW-1

Nested monitoring well MW-1 consists of three separate well casings installed within the same borehole (Photograph 8). Before installing the first well casing, a bottom plug consisting of bentonite chips was placed to approximately 2 feet below the total depth of the well. As well materials were added to the borehole, the outer casing of the sonic drill string was pulled up. The top of this bottom plug was confirmed by hard tag. After placement of the bottom plug, the casing/screen assemblies were installed as described below:

- The well casing for the deep well, including a 4-inch bottom cap and screen, were suspended in the borehole to the desired depth.
- The total depth of the well was then confirmed by hard-tagging the inside of the well.
- The filter pack material was then placed to approximately 2 to 4 feet above the top of the screen interval. During placement, the top of the filter pack was confirmed by hard tag measurements.

- During placement of the filter pack, the sonic drill casing was vibrated to seat the material. The top of the filter pack was hard-tagged after seating and additional material added to the top back to approximately 2 to 4 feet above the top of the screen interval.
- A seal of bentonite chips was then placed to approximately 10 feet below the planned total depth of the intermediate well.
- The intermediate and shallow wells were then installed following the same procedures described above for the deep well.
- The bentonite chip seal above the shallow well screen was placed to approximately 2 feet above this screen interval (approximately 54 feet bgs). The remainder of the annular seal was then filled with a cement grout in accordance with San Joaquin County requirements.

**Photograph 8. Three Well Casing Within Well MW-1**

Well casing (blank and screen) consisted of 2-inch-diameter (outside diameter) schedule 40 PVC. After installation, a steel locking well case was cemented in place surrounded by steel cement filled bollards for protection.

After a minimum of 24 hours after placement of the grout seal, each of the nested well screens were developed by bailing, surging, and pumping. Generally, each well was developed until free of suspended sediment, turbidity values were less than 10 Nephelometric turbidity units (NTU), or after a minimum of 10 casing volumes had been removed. During development, the pH, electrical conductivity (Ec), and temperature were also monitored using field instruments. A summary of the well development activities is presented on Table 5. Calculations of casing volumes used the well construction details presented on Table 4. At the end of development, a groundwater sample was collected from each of the nested wells and submitted for analysis as discussed in Section 2.6. Samples were placed in laboratory supplied containers. Samples submitted for cations and metals (Section 2.6) were filtered using a 45-micron filter prior to placement into the container.

**Table 5. Summary of Well Development**

Well ID	Date Developed	Total Well Depth (feet bgs)	Depth to Water (feet bgs)	Pumping Rate (gpm)	One CV (gallons)	Gallons Removed	pH	Ec (µmhos/cm)	Temp (°C)	Turbidity (NTU)
MW-1S	02/14/2023	74	53.11	1.7	3.4	205	6.65	1,140	19.21	131
MW-1I	02/14/2023	115.5	53.05	1.75	10.1	156	6.84	884	17.90	96
MW-1D	02/14/2023	164	62.62	1.25	16.5	160	6.86	878	17.90	31.8
TW-1	02/16/2023	188	53.10	15	198	6,100	6.89	801	18.6	0.0

Abbreviations: °C - degrees Celsius; µmhos/cm - micromhos per centimeter; CV – casing volume; gpm - gallons per minute

#### 2.4.2.2 Test Well TW-1

Test well TW-1 consists of a single well within the borehole. This well was constructed following the same procedures described above, with the following exceptions:

- A bentonite pellet bottom plug was placed to approximate depth of the bottom of the well material.
- An approximate 5-foot sump was placed below the bottom of the well screen.
- The filter pack was placed to approximately 10 feet above the top of well screen.
- Well casing (blank and screen) consisted of 6-inch-diameter schedule 80 PVC.

A minimum of 48 hours after placement of the grout seal, the test well was developed by bailing, surging, and pumping (Photograph 9). This well was developed until observed water was free of suspended sediment and turbidity values were below 5 NTU. During development, the pH, Ec, temperature, and oxidation-reduction potential (ORP) were monitored using a field instrument. A summary of the well development activities is presented on Table 4. The final stage of development consisted of conducting a step-drawdown pumping test to assess an appropriate pumping rate for the constant rate pumping test, as discussed in Section 2.5. The water sample from this well was collected during the constant rate pumping test also discussed in Section 2.5.

**Photograph 9. Pump and Other Equipment Installed Within TW-1 for Development**

## **2.5 Aquifer Testing**

Aquifer tests included performing a step-drawdown pumping test and constant rate pumping test. The methods and procedures used for each of these tests are discussed in the following sections.

### **2.5.1 Step-Drawdown Pumping Test**

As discussed in Section 2.4, the final stage of development for test well TW-1 consisted of performing a step-drawdown pumping test. For this test, the pumping well (TW-1) and each well within the nested monitoring well MW-1 were equipped with an In-Situ Inc. Level Troll 700 data logger (Photograph 5). These transducers are vented eliminating the need for a barometer to correct for barometric changes during the test. Prior to startup of the step-drawdown test, static water levels were recorded using a handheld electronic well sounder (Photograph 10) as summarized on Table 6.

**Photograph 10. Handheld Electric Well Sounder**

**Table 6. Summary of Handheld Static Water Level Measurements Prior to Step-Drawdown Test**

Well ID	Static Water Level (feet below measuring point) <sup>[1]</sup>
MW-1S	53.11
MW-1I	53.05
MW-1D	52.62
TW-1	52.30

Note: <sup>[1]</sup> The measuring point was used for all three nested wells in MW-1.

The step test consisted of pumping TW-1 at increasing rates of approximately 15, 20, 25, and 30 gpm. The pump was placed at approximately 135 feet bgs. Flow rates were recorded using a flow meter and totalizer (Photograph 11). Table 7 summarizes the recorded flow rates during the step test. Each transducer was programed to record water levels at 1 second intervals. Appendix F provides the raw data files from the transducers.

Each rate (step) was pumped for approximately 30 minutes to 1 hour each. The approximate maximum drawdown recorded in TW-1 was 18 feet at 15 gpm, 21.5 feet at 20 gpm, 35 feet at 25 gpm, and 52 feet at 30 gpm. After completion of the step-drawdown test, the pump was shut off and recovery recorded. TW-1 recovered to 100% of the static water level within approximately 6 minutes from pump shut off.

**Photograph 11. Flow Meter and Totalizer (both in same instrument)**

143	29.8
157	29.9
159	0

The approximate maximum drawdown recorded in MW-1D (screened in same zone as TW-1) at the conclusion of the last step was 0.17 feet and 0.023 feet in MW-1I. No observable drawdown was recorded for the shallow well MW-1S. Figure 10 provides the hydrograph for the pumping

well TW-1 and observation wells MW-1D and MW-I during the step-drawdown test. Analysis of this test is presented in Section 3.2.2.

### 2.5.2 Constant Rate Pumping Test

The constant rate test was conducted on April 12, 2023. Prior to startup of the test, static water levels were recorded in the pumping well TW-1 and the three observation wells in MW-1 using a handheld electronic well sounder, as summarized on Table 8. To allow for a higher pumping rate for the constant rate test, the pump was lowered to approximately 175 feet bgs.

**Table 8. Summary of Handheld Water Level Measurements During April 12, 2023, Constant Rate Aquifer Test (start time 0850; stop time 1715)**

Well ID	Time	Depth to Water (feet below measuring point) <sup>[1]</sup>
MW-1S	0816	50.04
	1145	50.06
	1241	50.04
	1407	50.04
	1540	50.00

	1406	132.28
	1537	132.49
	1730	49.72

1. Measuring point for MW-1S, MW-1I, and MW-1D is the same point at top of steel casing.

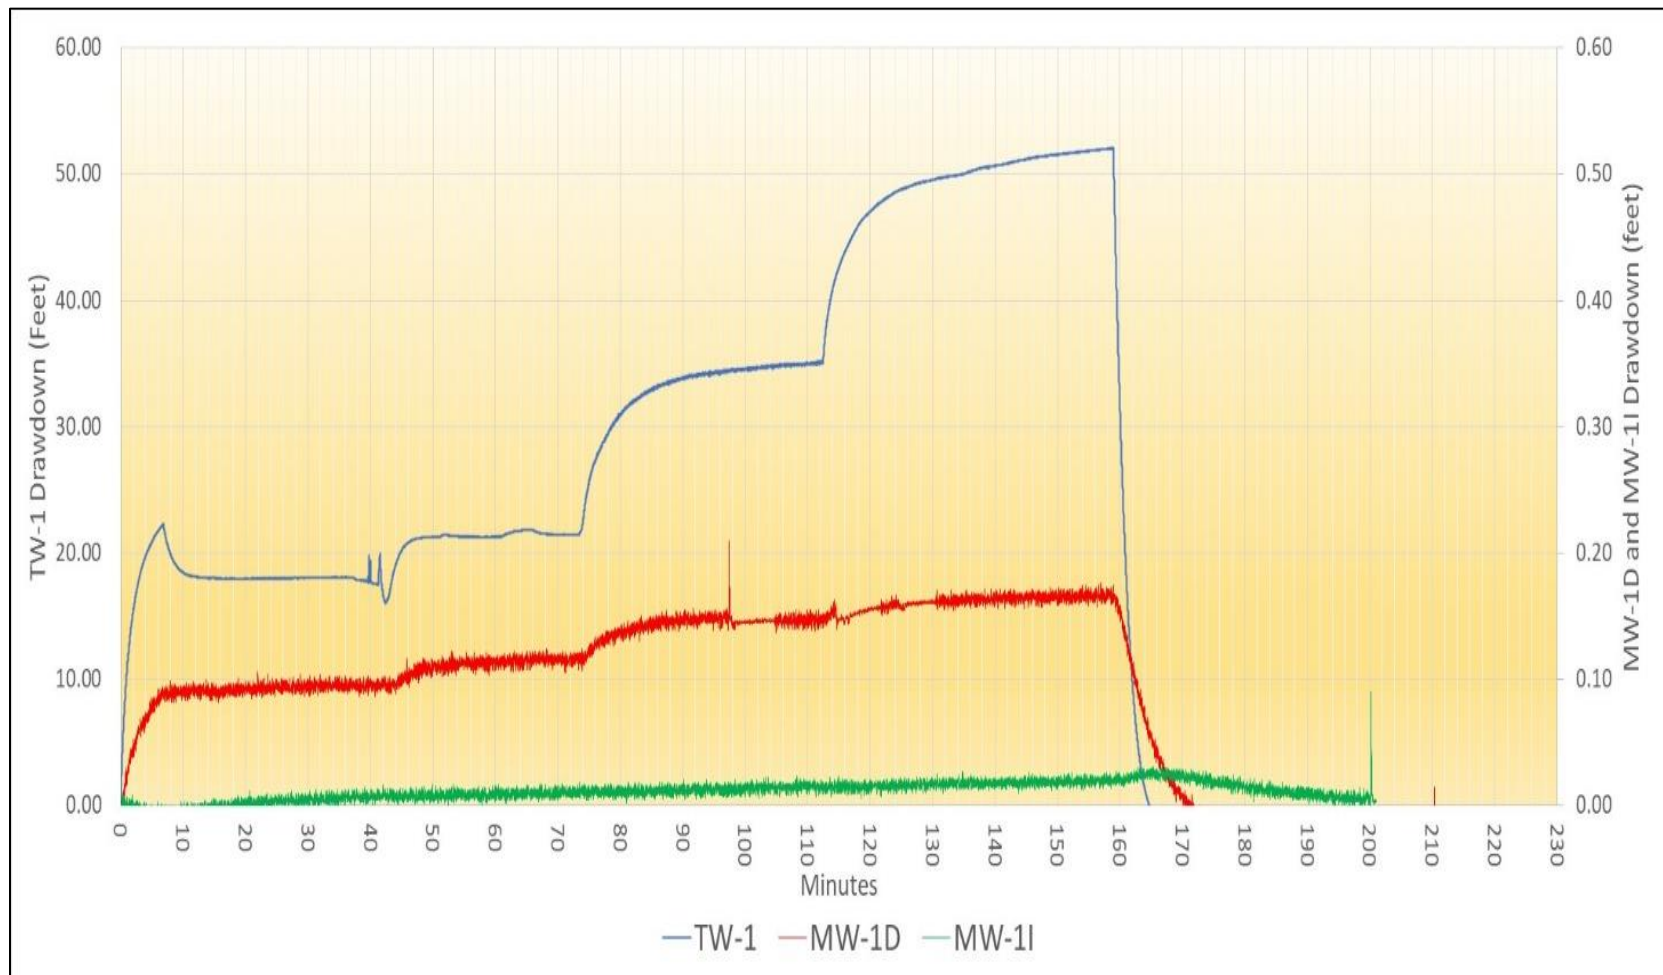

The transducers used for the project (Section 2.5.1) are rated for approximately 70 feet of water column above the transducers. As such, the start of the constant rate test consisted of pumping well TW-1 at 30 gpm until water levels leveled out then the transducer was lowered to 155 feet bgs. The pumping rate was then increased to 50 gpm but due to observed drawdown was decreased to a pumping rate of approximately 42 gpm for the duration of the test. For the first part of the test, the pressure transducers were programmed to record water levels at 1 second intervals. After approximately two hours of operation, the pressure transducers were reprogrammed to record water levels every 15 minutes for the remainder of the constant rate test.

During the test, flow rates and totalizer values were recorded from flow meter attached to discharge pipe (Table 9) and periodic water levels were recorded from the pumping well and observation wells using the handheld electronic well sounder (Table 8). The constant rate test ran for approximately 8 hours. The approximate maximum drawdown recorded for TW-1 was 96 feet, as illustrated on Figure 11, which provides the hydrograph for the pumping well and observation wells.

**Table 9. Summary of Data During April 12, 2023, TW-1 Constant Rate Pumping Test**

<b>Total Volume Extracted</b>		<b>22,725 gallons</b>					

Abbreviation: mV - millivolts

**Figure 10. Hydrographs for TW-1, MW-1D, and MW-1I Produced During TW-1 Step-Drawdown Test**

Near the end of the test, a groundwater sample was collected from pumping well TW-1 and submitted for analysis, as discussed in Section 2.6. Samples were placed in laboratory supplied containers. Samples submitted for cations and metals (Section 2.6) were filtered using a 45-micron filter prior to placement into the container. Field measurements of pH, Ec, temperature, and ORP were monitored using a field instrument prior to collection of the groundwater sample (Table 9).

After completion of the constant rate test, the pump was shut off and recovery recorded. Immediately prior to shut off, the pressures transducers were reprogrammed to recorded water levels at 1-second intervals. TW-1 recovered to approximately 100% of the static water level within approximately 18 minutes from pump shut off. Analysis of this test is presented in Section 3.2.3.

## **2.6 Laboratory Analysis**

As discussed above, soil and water samples were collected from the CPT, soil boring, and newly installed wells and submitted to laboratories for physical and chemical analysis as discussed below.

### **2.6.1 Soil Samples**

As discussed in Section 2.3 and summarized in Table 2, select soil samples were collected during the soil boring program and submitted for physical and chemical analysis. Two samples were also collected from the soil boring for MW-1 and submitted for grain size analysis for use in designing the screen and filter pack material for test well TW-1. Samples for chemical testing were submitted to Enthalpy Analytical of Orange, California, and for physical testing to Gulf Shore Exploration and Testing of Rancho Cordova, California. Copies of the analytical reports for this testing are presented in Appendix E. Table 10 summarizes the specific analysis and methods used for the testing. In addition to this testing, field measurements of Ec and pH were collected at 10-foot intervals within the vadose zone for soil borings B-1, B-3, and B-4. These measurements were collected by making a soil paste of selected sample using distilled water. The results of the soil testing program are discussed in Section 3.3.1.

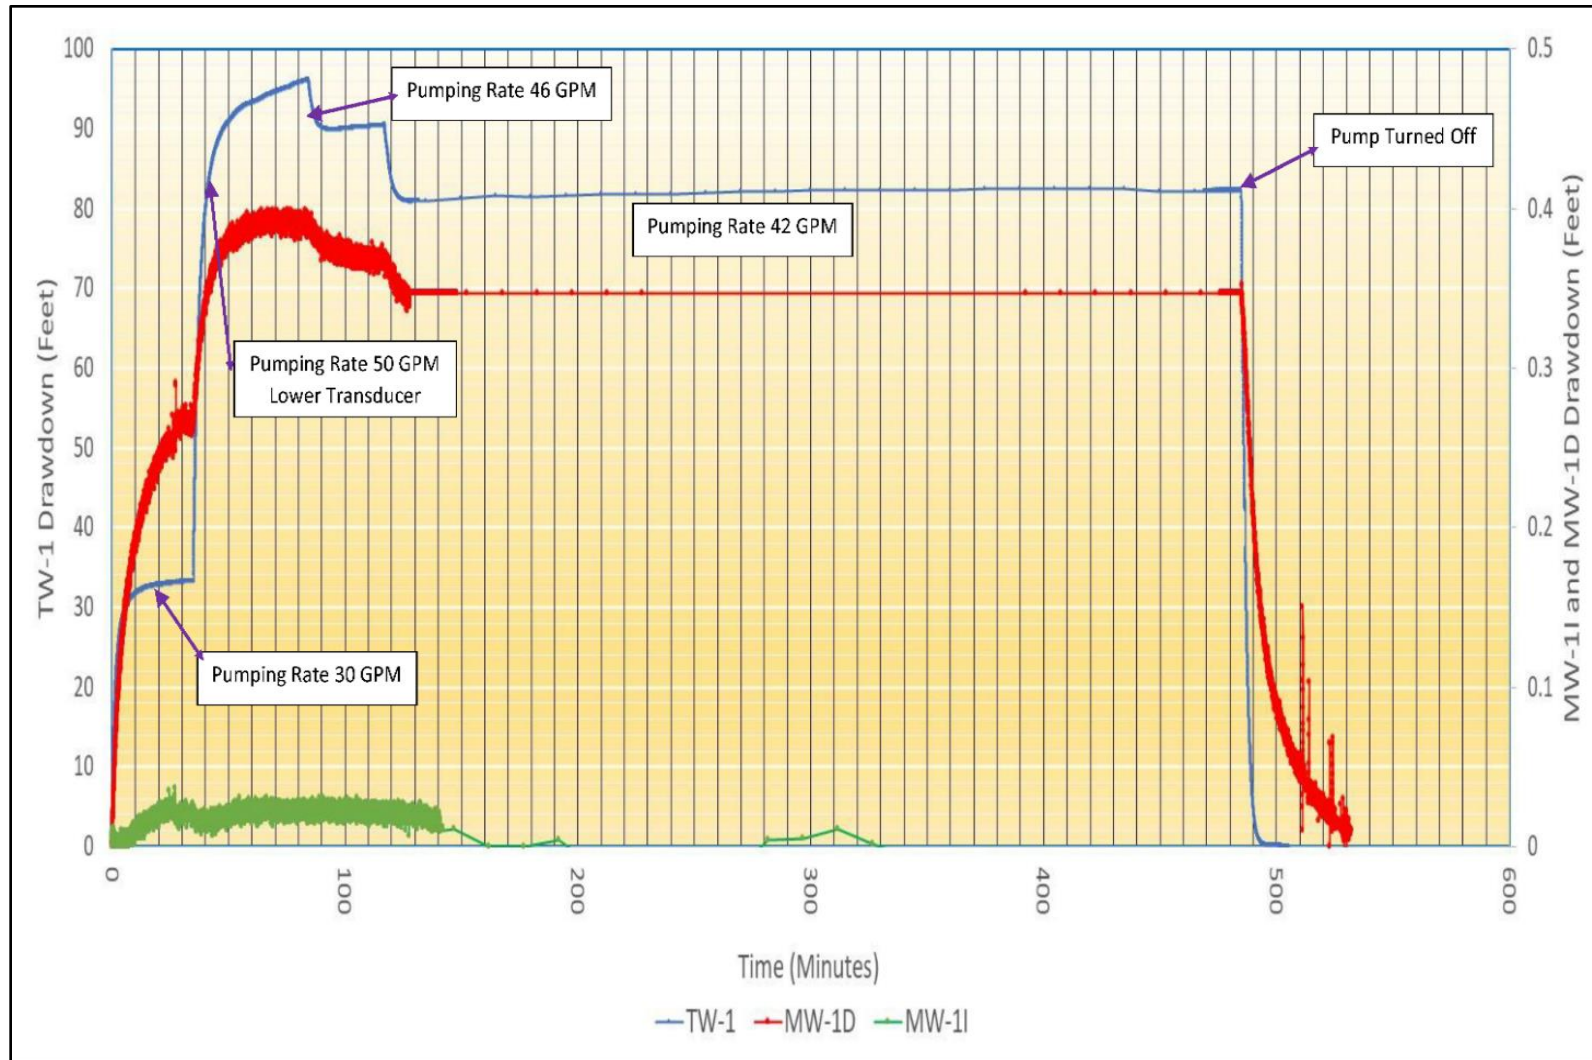

Figure 11. Hydrographs for TW-1, MW-1D, and MW-1I Produced During TW-1 8-hour Constant Rate Pumping Test

## 2.6.2 Groundwater Samples

As discussed previously, groundwater samples were collected from selected CPT points and from monitoring wells MW-1S, MW-1I, and MW-1D. These samples were submitted to Enthalpy Analytical for the parameters listed in Table 11. A water sample was also collected from the test well TW-1 and submitted for general parameters and drinking water constituents (Table 11). This sample was submitted to Alpha Analytical Laboratory, Inc. of Elk Grove, California. Copies of the analytical reports for the groundwater samples are presented in Appendix E. The results of these tests are discussed in Section 3.3.2.

### 3. RESULTS

This section presents the results of field activities discussed previously. Section 3.1 presents the results of infiltration testing conducted at CPT points and soil borings. Section 3.2 presents results of aquifer properties collected during aquifer testing, as discussed in Section 2.5. Results of chemical testing and physical testing (excluding permeability testing discussed in Section 2.1) are presented in Section 3.3. The results of lithologic data collected during the CPT, soil boring, and well installation programs are discussed as part of the update to the HCM discussed in Section 4.

#### 3.1 Infiltration Testing

As discussed in Section 2, various methods were used to assess infiltration rates of lithologic material within the vadose zone beneath the site. As discussed previously, estimates of the horizontal saturated hydraulic conductivity ( $K_h$ ) are provided by the CPT survey using normalized interpretative soil behavior types (SBTn). Appendix D provides figures that illustrate the results of these estimates in relationship to the identified soil types for the unsaturated zone (estimated depth to groundwater is 50 feet bgs). Figure 12 provides an example of these plots for CPT-1. As seen in these figures and summarized on Table 10,  $K_h$  values ranged from a high of 337 ft/day (CPT-1 at 33.5 feet bgs) to less than 0.0001 ft/day over numerous areas. Assuming a  $K_h$  to vertical hydraulic conductivity ( $K_v$ ) ratio ( $K_v/K_h$ ) of 0.1, Table 12 provides the range of estimated saturated infiltration rates for each CPT location.

**Figure 12. Plot of Estimated Permeability Data for CPT 1 Aligned with CPT Lithologic Data**

**Table 12. Summary of Saturated Hydraulic Conductivity Values from CPT Survey in Units of Feet Per Day (ft/day)**

CPT Number	Max Kh	Min Kh	Average Kh	Max Kv	Min Kv	Average Kv
1	337	0.0004	15.7	34	0.00004	1.57
2	31	0.0006	2.0	3.1	0.00006	0.31
3	121	0.0002	2.8	12	0.00002	0.28
4	29	0.0003	3.1	2.9	0.00003	0.31
5	34	0.0001	4.1	3.4	0.00001	0.41

Infiltration data were also assessed from conducting downhole permeability tests and laboratory permeability tests of soil cores during the soil boring program. The values collected from these methods are considered estimates of Kv. Infiltration estimates from the downhole permeability tests are calculated from the slope of the line for the end of the plot of time versus falling water levels, as illustrated on Figure 7. Seven tests were conducted with the four soil borings at varying depths and the plots for these tests are presented in Appendix D, with results summarized on Table 13. Values ranged from 0.14 ft/day at 30 feet bgs in soil boring B-1 to 1,843 ft/day at 50 feet bgs in soil boring B-3 (see Figure 6 for locations). The values reported for soil B-1 are considered low due to potential issues with sonic drilling that were corrected for the subsequent tests. Laboratory permeability tests were also conducted at varying depths, with results summarized on Table 13. These values ranged from 0.0002 ft/day at 5 feet bgs in soil boring B-1 to 4.4 ft/day at 10 feet in soil boring B-2. Copies of the laboratory tests are provided in Appendix E.

## 3.2 Aquifer Properties

Aquifer testing followed a process focused on assessing both the characteristics of the aquifer and aquifer properties. The first step involved developing an HCM using the lithologic data from pumping well TW-1 and observation well MW-1. A clear understanding of the hydrogeology including identification of formation boundaries is critical to accurately interpreting aquifer test data. The lithologic data also allowed the placement of screen intervals in the nested observation well MW-1 within specific zones that provided data on the interactions between these zones during regional monitoring and the aquifer tests.

After development of the HCM, appropriate assessment of the drawdown curves developed from the tests can be conducted using visual and analytical tools. The following sections present the HCM developed for analysis of the pump tests followed by the results of the step-drawdown test and constant rate test.

### 3.2.1 Hydrogeologic Conceptual Model

This section presents the HCM focused on lithology between the pumping well TW-1 and observation well MW-1 for use in assessing the aquifer tests conducted for the project. Section 4 presents an overall HCM for the overall recharge basin using information for the overall project.

Figure 13 presents a schematic hydrostratigraphic cross section constructed using the lithologic logs produced for TW-1 and MW-1 (Appendix C). Units shown on this figure are divided between low permeability silts and clays and permeable silty sands, sands, and gravels. The approximate distance between TW-1 and MW-1 is 115 feet. The total drilled depth for each well is approximately 200 feet bgs. Based on groundwater levels collected from these wells, first water occurs at approximately 50 feet bgs. As seen on Figure 13, five separate permeable zones separated by low permeability units were observed in the area of the wells, two above first water and three below. Three separate well screens were constructed in observation well MW-1 to monitor each of the zones below first encountered groundwater. The screen interval for the pumping well was placed across the interval of the lowest permeable zone encountered between 140 feet bgs to 180 feet bgs. Based on these data, it appears that the three zones monitored by the observation well do not have a direct hydraulic connection. This interpretation is supported by the results of the aquifer tests discussed in Sections 3.2.2 and 3.2.3. This interpretation also suggests that the zone screened by the pumping well TW-1 is a confined aquifer.

To further assess the hydraulic connection between the three screened zones, a hydrograph was constructed using water level data collected during the period prior to the aquifer tests. This hydrograph is shown on Figure 14 with data recorded as feet below the top of the well casing. As seen on this figure, all three zones illustrate a very similar upward trend during this period, suggesting that these three permeable zones are hydraulically connected, most likely by connection in areas in the vicinity of the project site. It also appears that MW-1D (deeper well) is responding

more to regional pumping in the area as shown by the response between March 5 to March 8, 2023. This regional connection between the three zones is discussed in more detail in Section 4. For the aquifer test, the HCM assumes that the three zones are not directly hydraulically connected; that is supported by the response to pumping in TW-1 as discussed in Sections 3.2.2 and 3.2.3.

### 3.2.2 Step-Drawdown Test

The primary objective of the step-drawdown test was to develop the appropriate pumping rate for the constant rate pumping test. Figure 10 shows the hydrograph for pumping well TW-1 during the step test. Table 14 shows the pumping rates and calculated specific capacities in gallons per minute per foot of drawdown (gpm/ft). Using this data, a pumping rate of 42 gpm was used for most of the constant rate pumping test. Table 12 also provides the specific capacity calculated for the constant rate test.

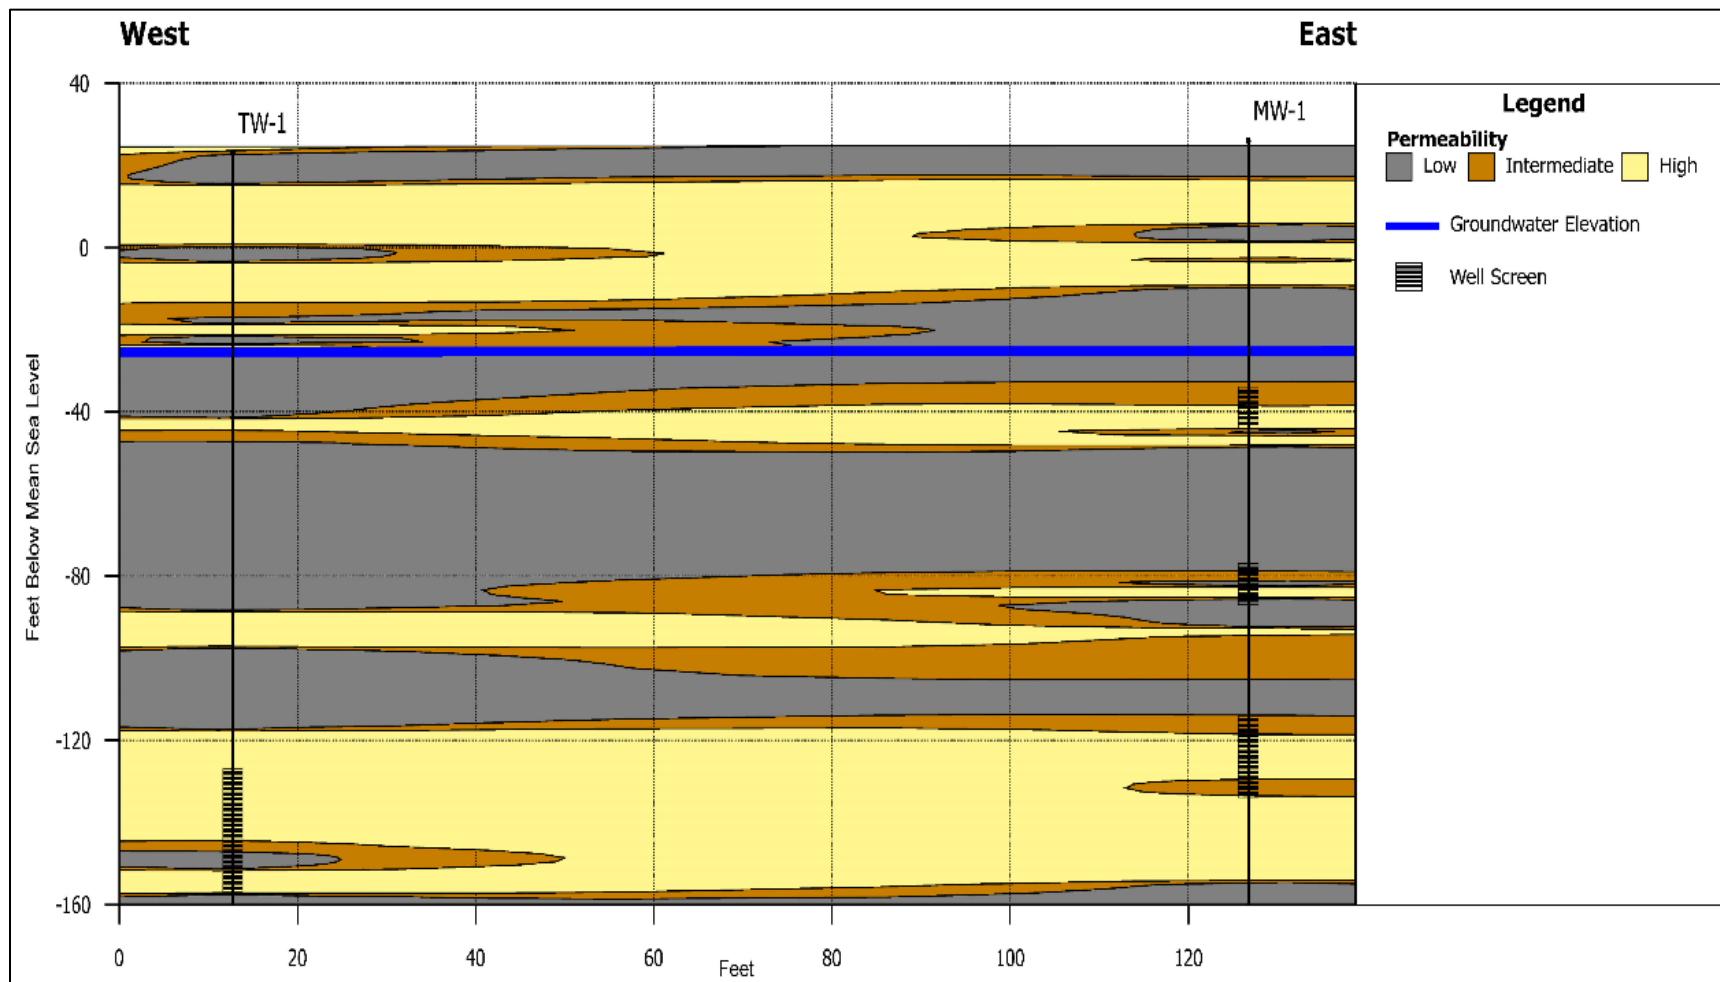

**Table 14. Summary Calculated Specific Capacities and Transmissivity and Hydraulic Conductivity Using Empirical Formula for Specific Capacity**

Pumping Rate (gpm)	Maximum Drawdown (feet)	Specific Capacity (gpm/ft)	Transmissivity (gpd/ft)	Transmissivity (ft <sup>2</sup> /day)	Hydraulic Conductivity (ft/day)
15	18	0.83	1,667	223	5.57
20	20	0.93	1,860	249	6.22
25	25	0.71	1,429	191	4.77
30	30	0.58	1,154	154	3.86
42	96	0.44	875	117	2.92

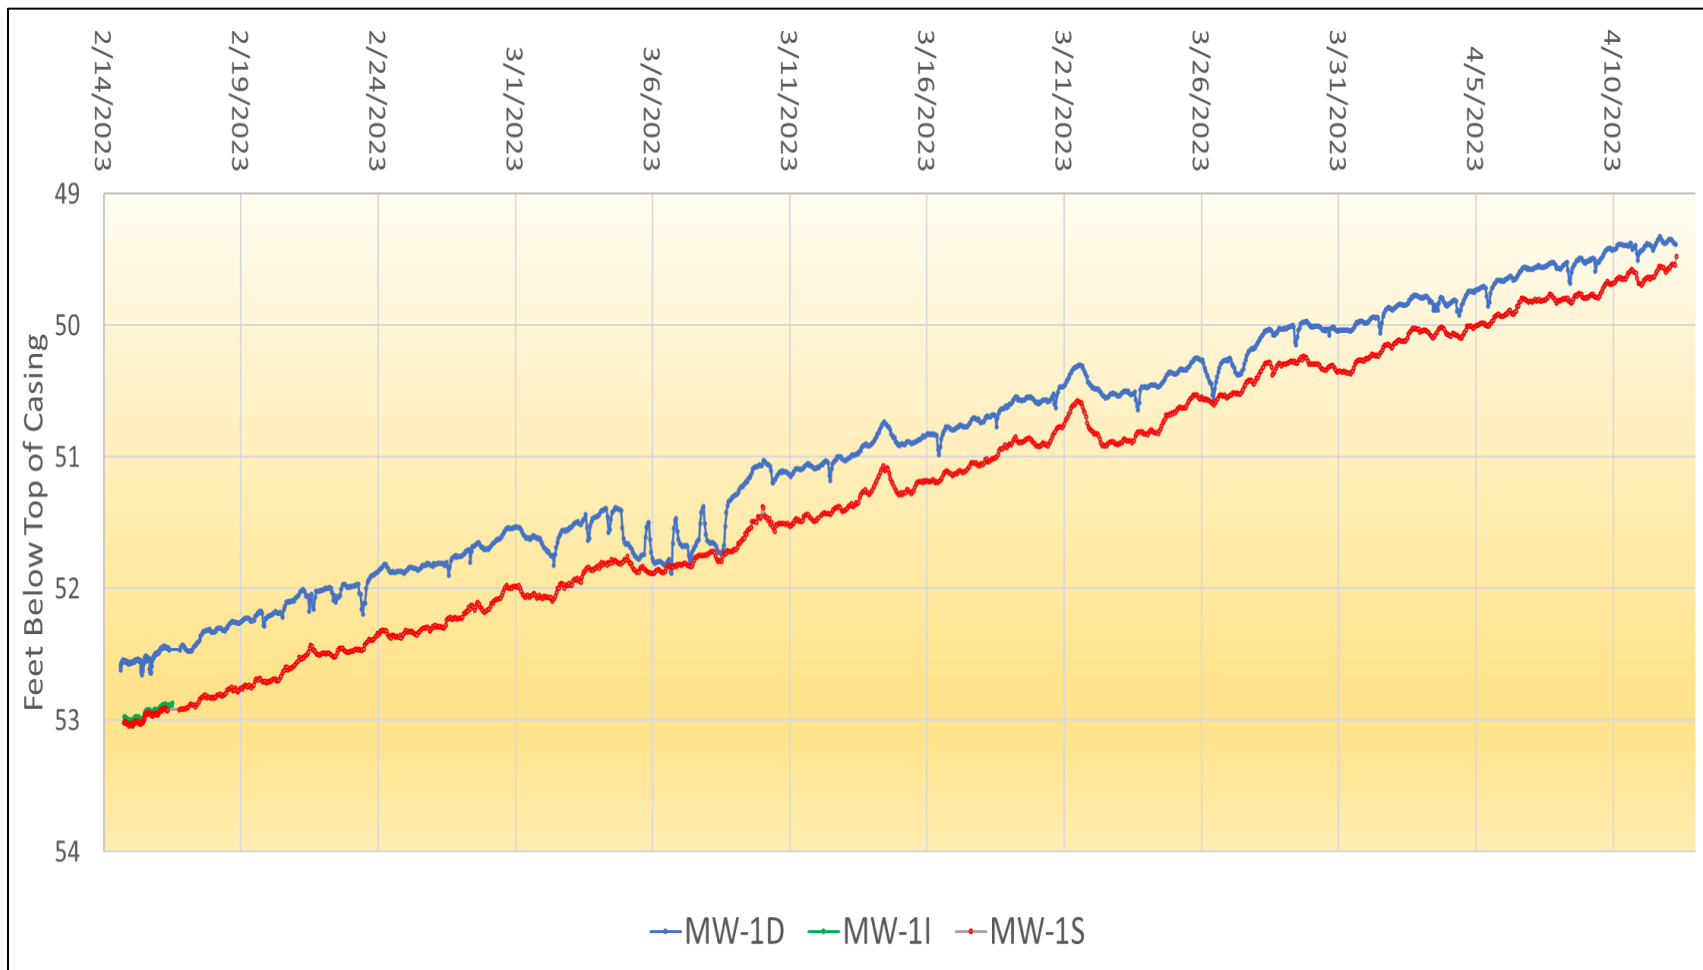

Abbreviations: ft<sup>2</sup>/day - square feet per day; gpd/ft - gallons per day per foot

Well efficiency was assessed using data from the step-drawdown tests and calculations provided by the software package AQTESOLV™. This calculation indicated a very poor well efficiency (less than 10% efficiency) signifying the majority of drawdown was due to well losses. If the test well TW-1 will be used for pumping at a future date, more aggressive well development methods should be conducted to improve the well efficiency.

Preliminary estimates of aquifer properties and aquifer interactions were developed from this test that assisted in the interpretation of the constant rate pumping test. First, an assessment of the hydraulic connection between the three separate zones in MW-1 was conducted by observation of the hydrograph produced for these wells during the step-drawdown test. Figure 11 presents this hydrograph that shows well MW-1D screened within the same zone as TW-1 responds almost immediately to start of pumping and changes in pumping rate indicating a direct hydraulic connection.

**Figure 13. Schematic Hydrostratigraphic Cross Section Between Pumping Well TW-1 and Observation Well MW-1 Showing Low Permeability Zones (red) and Permeable Zones (green)**

**Figure 14. Hydrograph for Observation Well MW-1D (deep), MW-1I (intermediate), and MW-1S (shallow)**

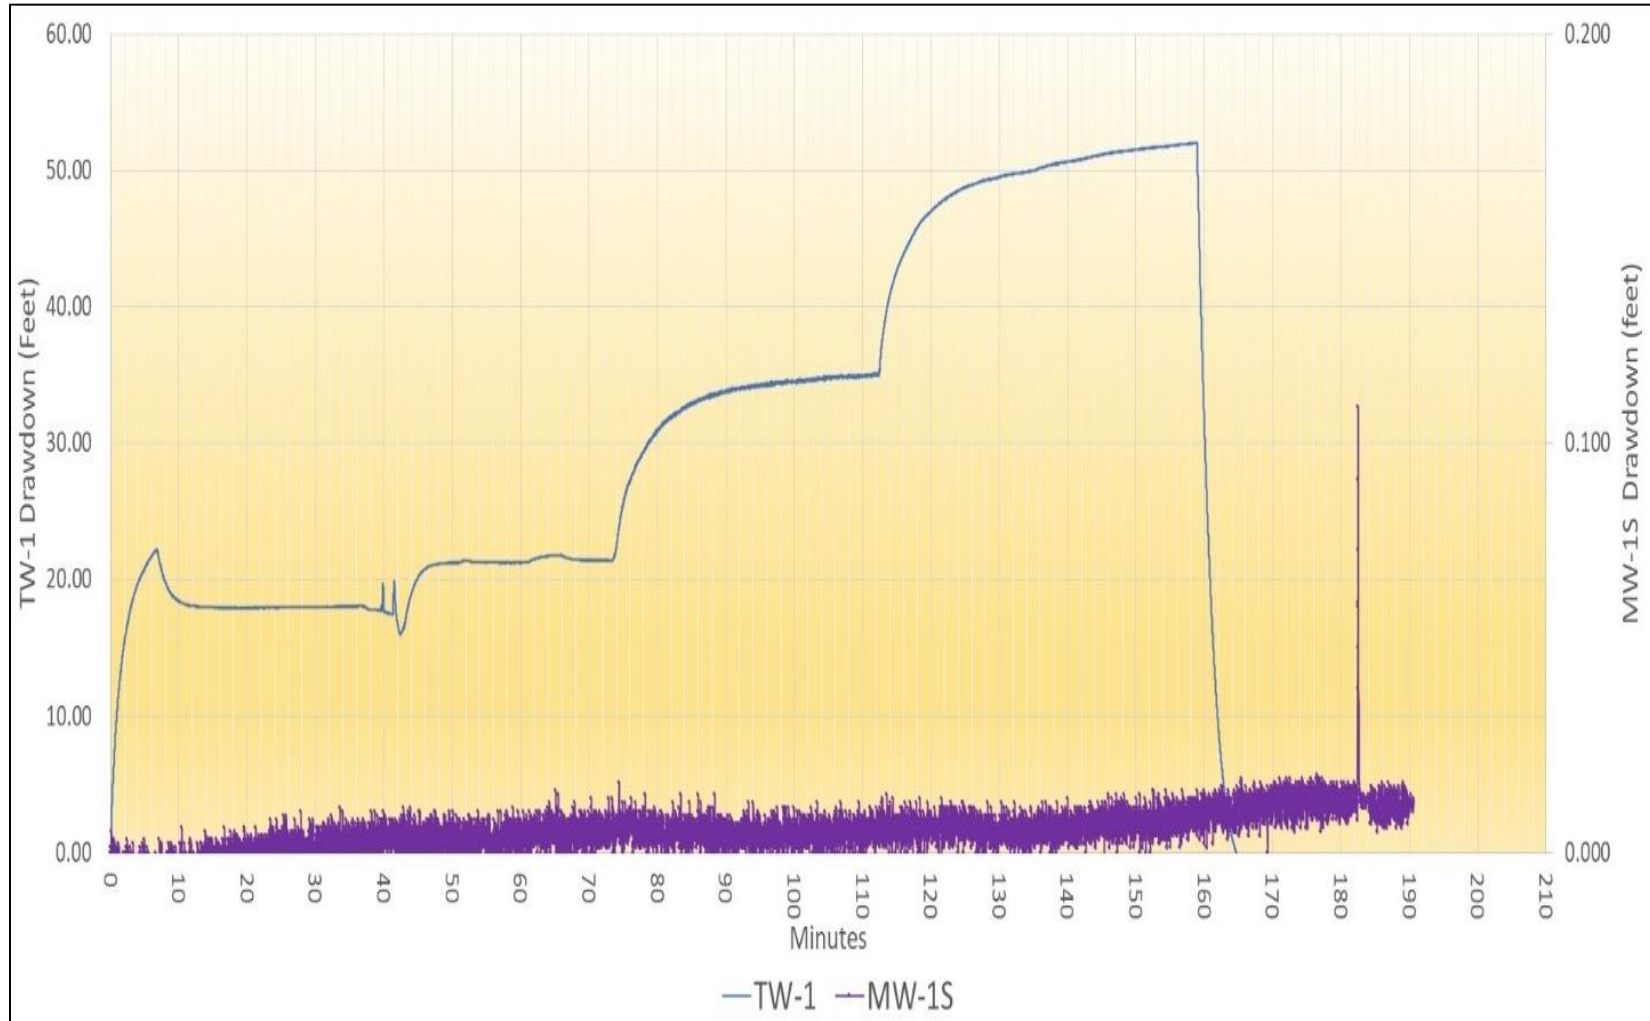

In contrast, MW-1I appears to represent response from leakage through the low permeability zone as does MW-1S although to a lesser extent as shown on Figure 15. These responses are consistent with the interpretation that the pumped zone is a leaky confined aquifer with no direct hydraulic connection to the upper two zones monitored by MW-1. As such, aquifer properties can only be assessed from the aquifer test within TW-1 and MW-1D.

Using an empirical formula developed by Driscoll (1986), the specific capacity can be used to estimate the transmissivity of the pumped aquifer. For a confined aquifer, this equation is  $T = 2,000 \times \text{specific capacity}$  (T in units of gpd/ft of drawdown). As shown in Table 14, T values using this equation ranged from 875 gpd/ft (117 ft<sup>2</sup>/day) to 1,860 gpd/ft (249 ft<sup>2</sup>/day). Using an aquifer thickness of 40 feet, hydraulic conductivity (K) values calculated from this equation range from 2.92 ft/day to 6.22 ft/day, consistent with the well sorted sand observed during drilling within this zone. As indicated above, TW-1 had a very low well efficiency and as such these calculated T values from specific capacity are most likely low.

An initial analysis of aquifer parameters from the step-drawdown test was also conducted using AQTESOLV™ that allows comparison of the drawdown curves to type curves developed from mathematical solutions of the flow equation. Type curves developed from these methods are based on specific assumptions about the characteristics of the aquifer. For example, the classic Theis solution assumes that the aquifer has infinite areal extent and is homogeneous, isotropic, and of uniform thickness. If the actual aquifer characteristics are distinctly different from these assumptions, then the drawdown curves observed for wells during the test will not match the type curves and aquifer parameters cannot be calculated. However, departures from the type curves can provide important qualitative interpretations of the aquifer characteristics. For example, although curves developed for MW-1I and MW-1S indicate response to pumping, this response was from leakage through the confining layer and the drawdown curves cannot be used for assessment of aquifer properties.

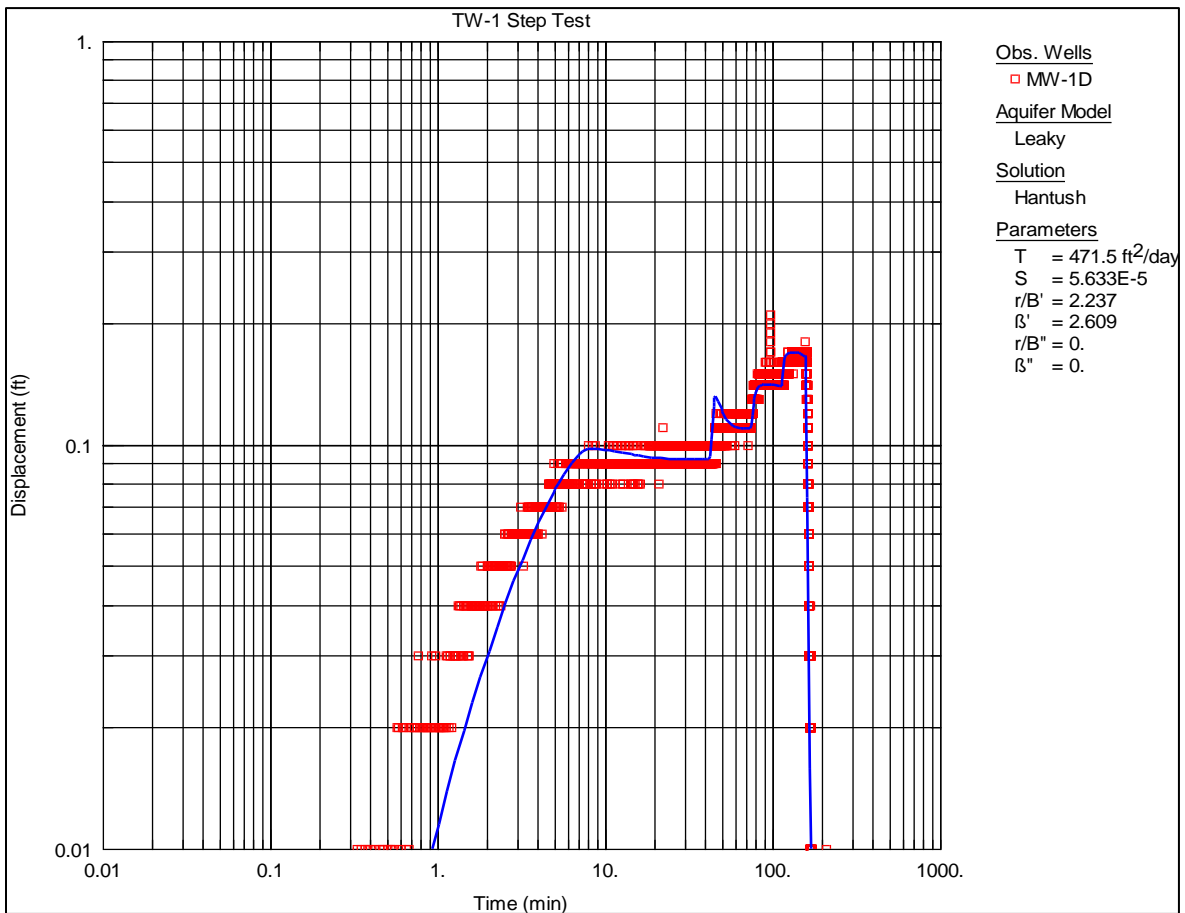

For TW-1 and MW-1D, flow equations developed for a leaky confined aquifer within AQTESOLV™ were used to provide a preliminary assessment of aquifer properties. These methods included Hantush (1960) and Moench (1985). Hantush (1960) derived a solution for unsteady flow to a fully penetrating well in a homogeneous, isotropic, leaky confined aquifer. Moench (1985) derived a solution for unsteady flow to a fully penetrating, finite-diameter well with wellbore storage and wellbore skin in a homogeneous, isotropic leaky confined aquifer. In AQTESOLVE™, there are three configurations for simulating a leaky confined aquifer with aquitard storage for this method as follows:

- Case 1 assumes constant-head source aquifers supply leakage across overlying and underlying aquitards.
- Case 2 replaces both constant-head boundaries in Case 1 with no-flow boundaries.
- Case 3 replaces the underlying constant-head boundary in Case 1 with a no-flow boundary.

**Figure 15. Hydrograph Showing Response from MW-1S During TW-1 Step-Drawdown Test**

The solution plots and reports for each of these analyses are provided in Appendix G. Figure 16 provides an example of the plot for the MW-1D Hantush (1960) solution. As seen on these plots, these configurations show relatively good fits and are considered reasonable preliminary estimates of T and storativity (S) values for the aquifer zone analyzed for the test although the results for TW-1 are considered low due to the poor well efficiency of this well as discussed above. Table 15 summarizes the T, S, and K (using aquifer thickness of 40 feet) values using these methods. Based on the HCM discussed above, the values calculated are considered the most accurate values of T, S, and K for the aquifer tested with calculated K values consistent with a well sorted sand or sand and gravel as observed during the drilling of MW-1 and TW-1 within this aquifer zone.

**Figure 16. Example Plot and Solution for MW-1D Using the Hantush (1960) Solution**

Redline represents the drawdown curve for MWE-1D, and the blue line shows the best fit curve from the Hantush (1960) solution.

### 3.2.3 Constant Rate Aquifer Test

Analysis of the constant rate aquifer test also used the software package AQTESOLV™. Based on the HCM and results of the step-drawdown test, the analysis was conducted for the drawdown curves developed by the pumping well TW-1 and observation well MW-1D. Well construction details for these wells are provided in Table 4. The pumping rates during the test are provided on Table 9.

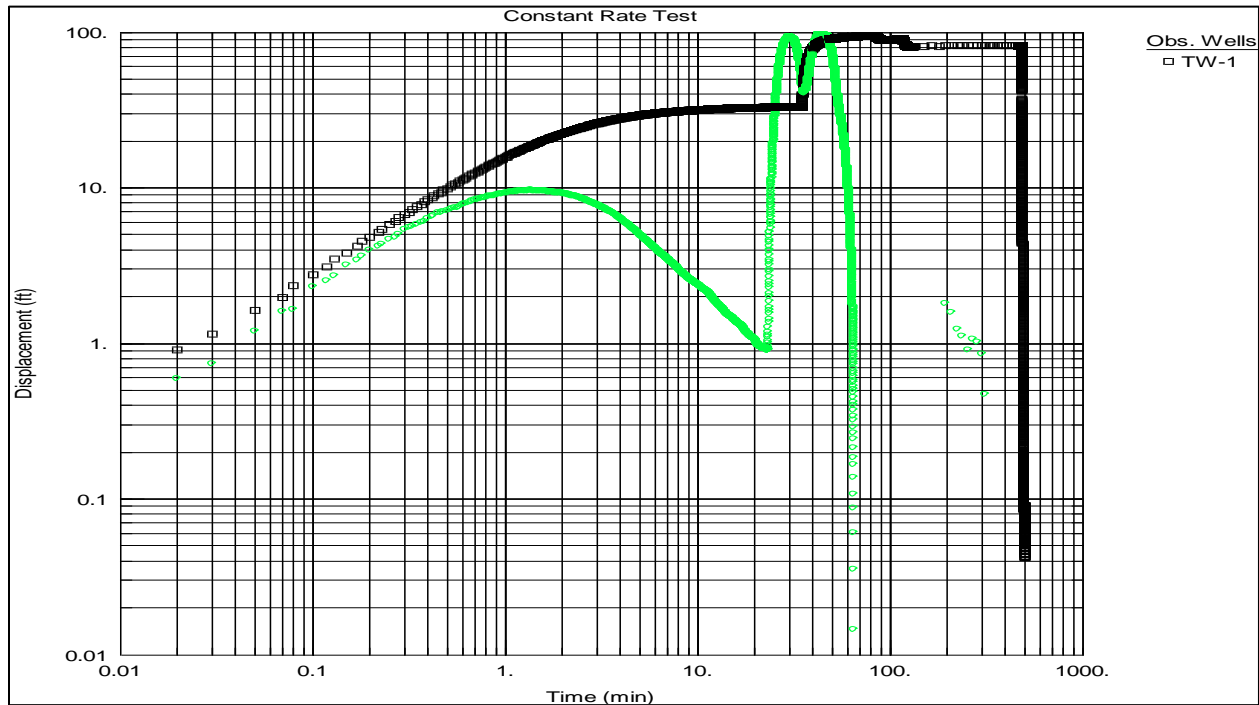

Prior to conducting curve matching, the drawdown data was evaluated using derivative analysis provided by AQTESOLV™. Derivative analyses are an invaluable tool for diagnosing a number of distinct flow regimes. However, due to the short duration of the constant rate test (8 hours), this analysis was only used to select portions of the curve that would be appropriate for the Cooper-Jacob straight line method to calculate T and S values. Areas where the derivative plot reaches a plateau are portions of the drawdown curve that indicates infinite acting radial flow and are appropriate for the Cooper-Jacob straight line method to calculate T and S values of the aquifer. Figure 17 and Figure 18 show the derivative plots for MW-1D and TW-1. For MW-1D (Figure

17), plateaus were observed at 4 to 15 minutes, 20 minutes, and 35 minutes, and for TW-1 (Figure 18), plateaus were observed at 1 to 2 minutes, 28 to 32 minutes, and 40 to 50 minutes.

**Figure 17. Derivative Plot (Green Line) for Well MW-1D**

Plateau areas show where it is appropriate to use the Cooper-Jacob straight line method.

**Figure 18. Derivative Plot (Green Line) for Well TW-1**

Plateau areas show where it is appropriate to use the Cooper-Jacob straight line method.

Plots for the various curve matching solutions used for analysis of this pump test are presented in Appendix G. Summaries of the calculated T and S values from these analyses are presented in Table 15. A brief discussion of each of the methods used is presented below with summaries of the methods used as discussed on the AQTESOLV™ User Manual. Other than use of the Cooper-Jacob (1946) method to provide preliminary estimates of T and S, the other solutions were selected based on the HCM and diagnostic analysis discussed above, which indicates that the aquifer analyzed for this test is a leaky confined aquifer system. The pumping well for this test is assumed to be fully penetrating, whereas the observation well used for the analysis is partially penetrating.

### 3.2.3.1 Cooper-Jacob (1946)

The Cooper-Jacob (1946) straight line method is used to obtain preliminary estimates of T and S. This method should only be used for areas of the drawdown curves that indicate radial flow in an infinite-acting confined aquifer. As discussed above, areas where the derivative plot reaches a plateau are portions of the drawdown curve appropriate for the Cooper-Jacob straight line method to calculate T and S values of the aquifer. The calculated T and S values from these plots (Table 15) represent preliminary estimates that are useful in constraining the analysis of the drawdown curves using other solutions. As seen on Table 15, T and K values are within the range of values reported for solutions. However, the S values are high and are not consistent with values expected for a semi-confined aquifer.

### 3.2.3.2 Hantush (1960)

Hantush (1960) derived a solution for unsteady flow to a fully penetrating well in a homogeneous, isotropic leaky confined aquifer. The curve fit for both wells show relatively poor fits for the early

time data and relatively good fit for the late time data. Through a simple transformation of the time variable, Agarwal (1980) devised a procedure that uses solutions developed for drawdown analysis to analyze recovery data. These plots are also provided in Appendix G for this method and the Moench (1985) methods discussed below and reported in Table 15 as results for the recovery analysis. The curve fit for MW-1D shows a relatively good fit for this curve whereas TW-1 shows a relatively poor fit.

### **3.2.3.3 Moench (1985)**

Moench (1985) derived a solution for unsteady flow to a fully penetrating, finite-diameter well with wellbore storage and wellbore skin in a homogeneous, isotropic leaky confined aquifer with three configurations. Based on the HCM described above and response of the observation wells in the underlying aquitard and aquifer, either Case 1 or Case 3 best represents conditions of the aquifer test performed at the site. For Case 3, the constant-head boundary would be the lower aquitard instead of the upper aquitard as assumed for the solution. Solutions were performed for both Case 1 and Case 3. As seen on the plots presented in Appendix G for these solutions, both configurations show good fits for the early and late time data of the pumping wells and observation well. For the observation wells, the plots show very good fits for early and late time data. For the recovery plots, the curve fits are very good for both wells with both Case 1 and Case 3 solutions. The calculations for T and S from the Moench Solutions for MW-1D are believed to be the most representative of the aquifer zone screened from these wells (Table 15). The K values calculated from these tests are consistent with well sorted sands or sands and gravels as observed during the drilling of MW-1 and TW-1 within this aquifer zone. The reported S values from MW-1D from these methods (0.001 to 0.002) are consistent with a semi-confined aquifer.

### **3.2.3.4 Theis (1935) Residual Drawdown/Recovery**

Applying the principle of superposition in time, Theis (1935) proposed a straight-line solution for determining T and S from residual drawdown data collected during the recovery phase of a pumping test. The solution assumes a line source for the pumped well and therefore neglects wellbore storage. Without the influence of boundary effects, the value of  $S/S'$  determined from the intercept of the straight line with the  $\log(t/t')$  axis should be close to unity. A value of  $S/S' > 1.0$  indicates the influence of recharge during the test. Conversely, a value of  $S/S' < 1.0$  suggests the presence of a barrier or no-flow boundary. As shown on the plots presented in Appendix G, the  $S/S'$  values for TW-1 and MW-1D analyzed for this test are greater than 1 (41.1 to 10.94) suggesting recharge is occurring during the recovery test. This interpretation is consistent with observations made during the pumping test and the conceptual model discussed above.

## **3.3 Laboratory Testing**

Soil and water samples were collected from the CPT, soil boring, and newly installed wells and submitted to laboratories for physical and chemical analysis as discussed below. The results of permeability testing collected from soil sample are discussed in Section 3.1. The results of other soil physical testing and chemical testing are presented below in Section 3.3.1. The results of groundwater chemical testing are presented in Section 3.3.2.

### 3.3.1 Soil Physical and Chemical Testing

As discussed in Section 2.6.1, select soil samples were collected during the soil boring program and submitted for analysis of physical and chemical parameters. Physical parameters included the following:

- Grain size distribution—ASTM International D422
- Atterberg Limits—ASTM International D4318
- Moisture content—ASTM International D-5084/D-2434
- Permeability—ISM02 Exhibit B

Laboratory reports for these analyses are provided in Appendix E. Permeability results are discussed in Section 3.1. Table 16 summarizes the results of the other physical testing completed for these samples.

**Table 16. Summary of Soil Physical Testing Results**

Location	Depth (Feet BGS)	Percent Gravel	Percent Sand	Percent Fines	USCS	Moisture Content (Percent)
B-1	5	0	47	53	CL	14.4
	20	7	72	21	SC	10.2

B-4	5	0	27	73	ML	14.4
	20	0	56	44	SC-SM	6.7
	60	1	81	18	SC	14.4

Field measurements of Ec and pH were also collected at 10-foot intervals within the vadose zone for soil borings B-1, B-3, and B-4. Table 17 presents the results of these field tests along with periodic readings of deionized water (DW) for comparison of the results and drift of meter during measurements.

Abbreviation:  $\mu\text{S}/\text{cm}$  - microSiemens per centimeter

Chemical parameters included the following:

- Cations—Calcium, iron, magnesium, manganese, sodium, potassium
- Anions—Chloride, alkalinity, nitrate/nitrite, phosphate, sulfate/sulfide
- General parameters—Total organic carbon (TOC)

- Metals—Title 22 metals

Laboratory results for these constituents are provided in Appendix E. A summary of these results is provided on Table 18.

### 3.3.2 Groundwater Testing

Groundwater samples were collected during the CPT program and from the three wells in nested observation well MW-1 and the test well TW-1 and submitted for the following analysis:

- Cations—Calcium, iron, magnesium, manganese, sodium, potassium
- Anions—Chloride, alkalinity, nitrate/nitrite, phosphate, sulfate/sulfide
- General parameters—TOC, total dissolved solids (TDS)
- Metals—Title 22 metals

In addition to these parameters, pH, Ec, temperature, oxidation-reduction potential was measured using a field instrument, as discussed in Sections 3.1 and 3.3. Table 19 summarizes the results of detected constituents from these analyses. Appendix E provides a copy of the laboratory reports. Table 19 also provides analytical results for potential source waters that include delta water, WID water, and finished water. These results were provided by the City of Stockton and Table 19 provides the most recent results for these analyses. Section 4.3 discusses results from previous sampling rounds from these sources.

The sample from TW-1 was also submitted for the full drinking water analysis. The laboratory reports for this testing are provided in Appendix E. Of these analyses, the only constituent reported other than those presented on Table 17 is 1,2,3-trichloropropane (1,2,3-TCP) at a concentration of 0.13 micrograms per liter ( $\mu\text{g/L}$ ).

## 4. HYDROGEOLOGY

A detailed description of the hydrogeology based on existing information was presented in the final work plan (Geosyntec 2022a). Using this data, the final work plan provided an initial HCM that identified data gaps that formed the basis for the field investigations discussed in Sections 2 and 3. This section presents an update to hydrogeology, including the HCM, using the data collected for this project. Since these data are site specific, the regional geology is not repeated, and the reader is referred to Section 2.1 of the final work plan.

### 4.1 Site Hydrostratigraphy

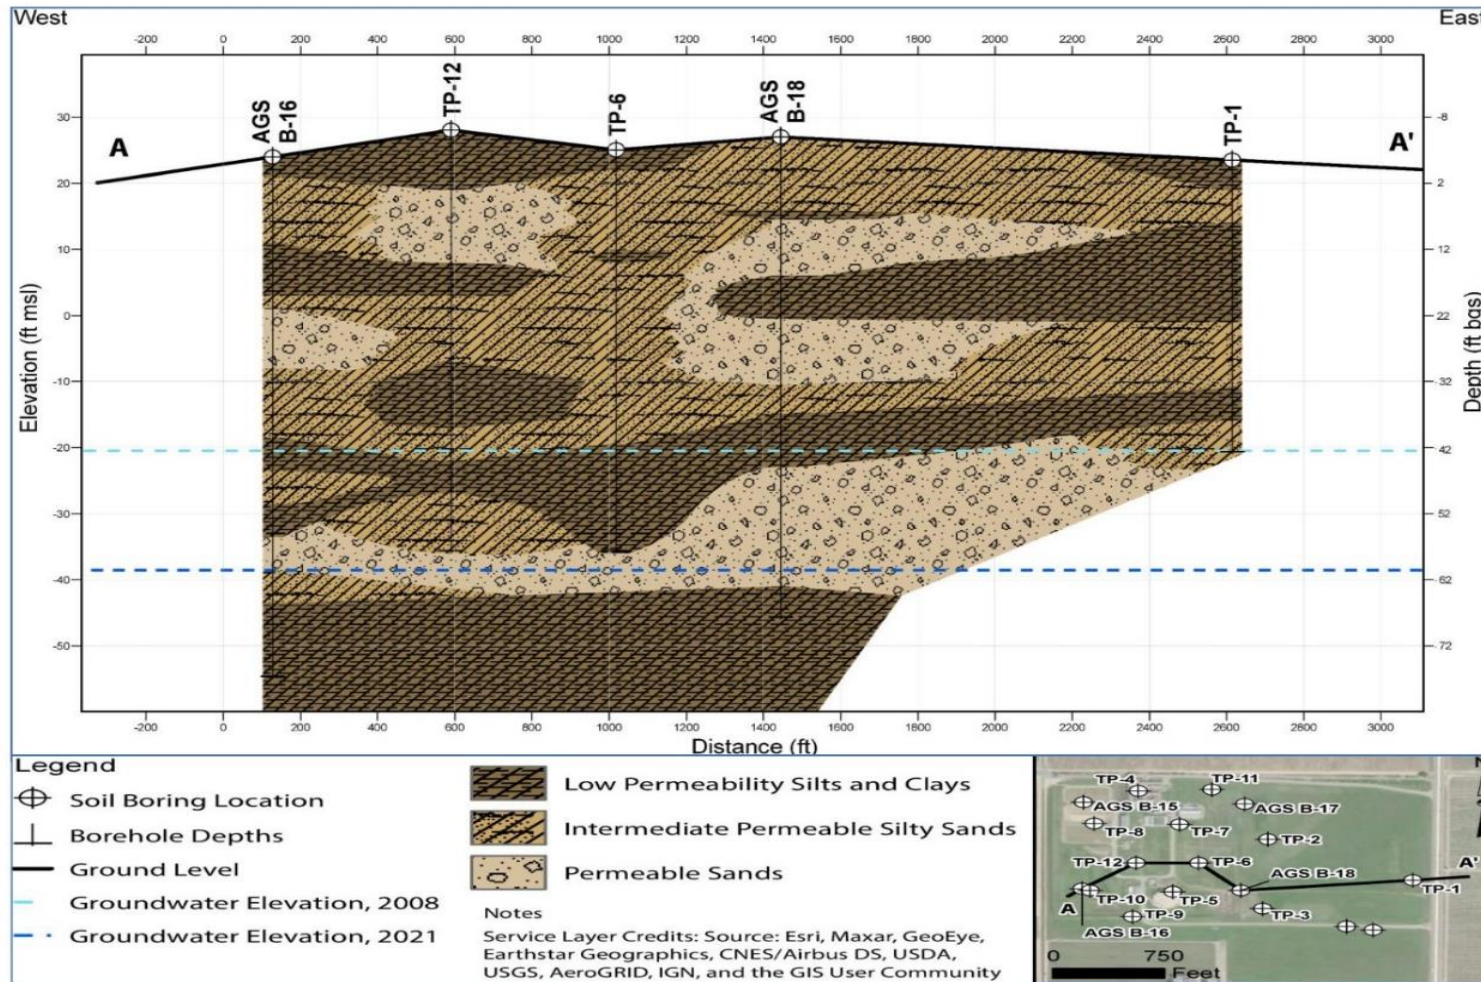

The site hydrostratigraphy presented in the final work plan is based on geologic logs provided in Kleinfelder (2009) and the results of the ERP survey conducted for this project (Geosyntec 2022b). Figure 10 from the final work plan, reproduced in this report as Figure 19, presented a hydrostratigraphic cross section using the existing site information that identified stratigraphic units observed within the proposed groundwater recharge area. These data were supplemented by the electrical resistivity profile conducted as part of Task 3 for the project. Figure 12 from the final work plan, reproduced in this report as Figure 20, presents a fence diagram of the seven ERP profiles conducted across the site. For reference, the cross-section line depicted in Figure 19 is shown on Figure 20.

Based on discussions of geologic units presented in the final work plan, the unit encountered at the site is the Laguna Formation. Subunits within the Laguna Formation were distinguished based on relative permeabilities as follows:

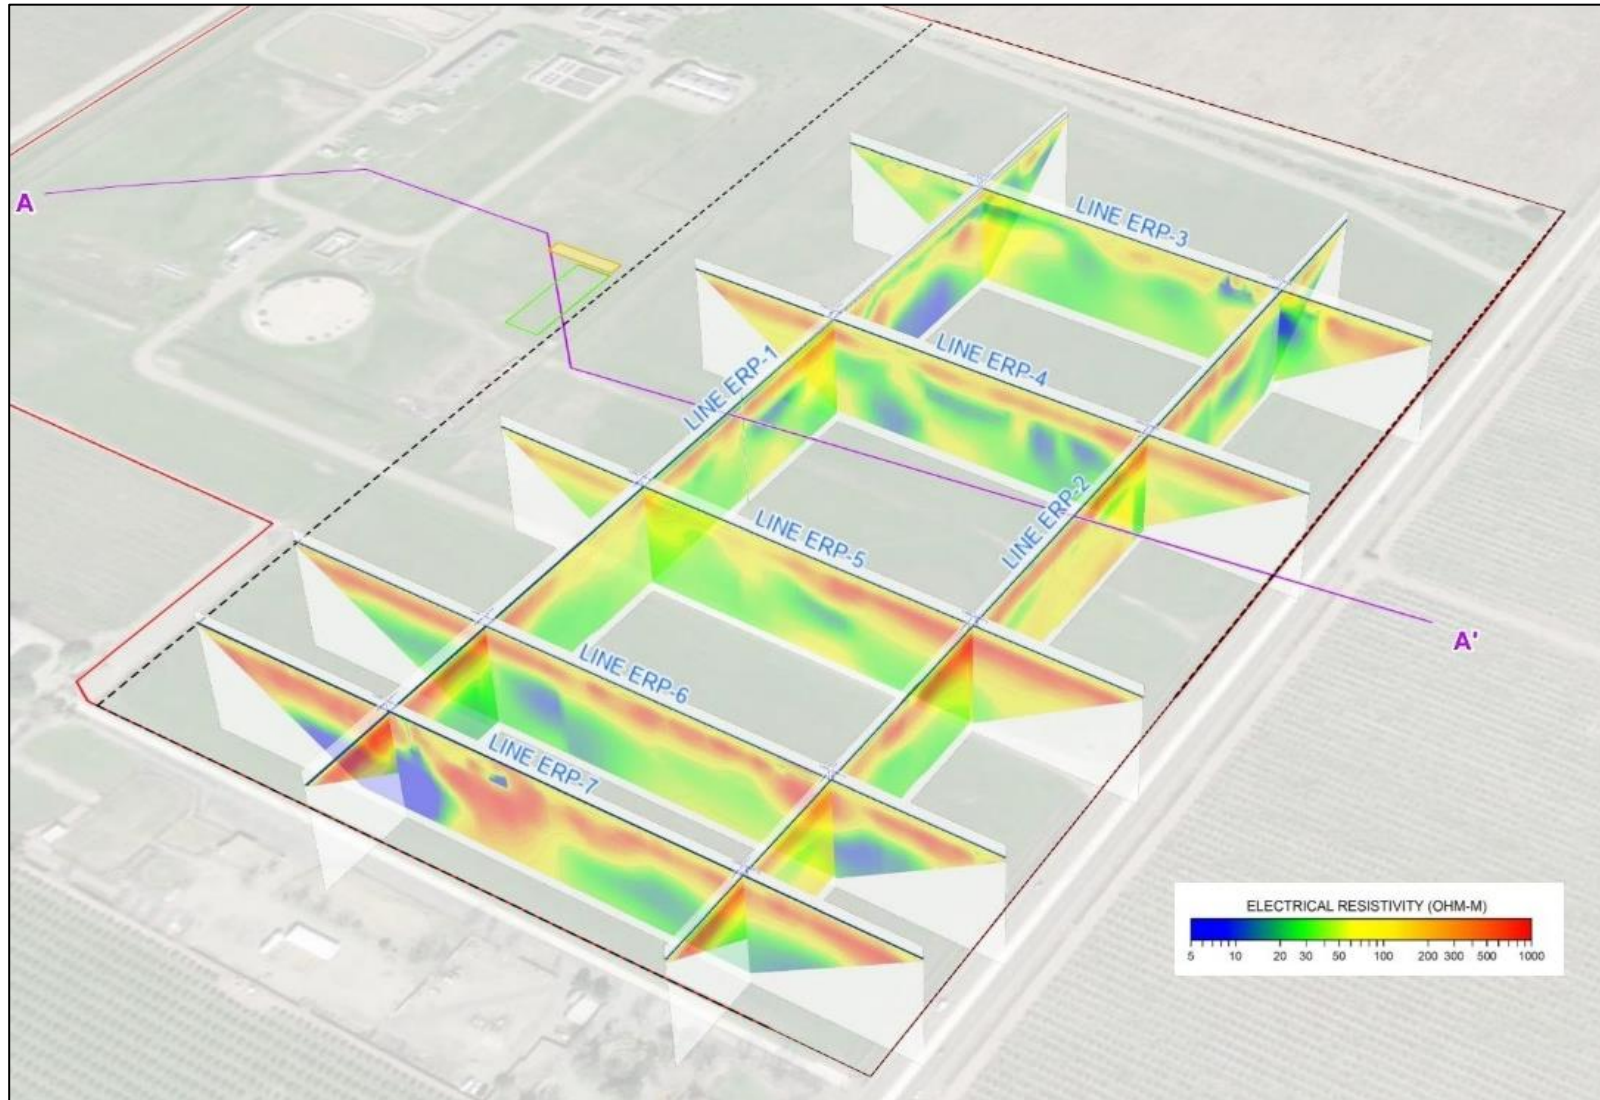

- Low permeability silts and clays—blue colors on ERPs
- Intermediate permeable silts sands—green and yellow colors on ERPs
- Permeable sands—orange and red colors on ERPs

As seen on these figures, the site is underlain by interbedded sands, silty sands, silts, and clays characteristic of former small river channels and floodplains. Where the cross section in Figure 20 suggests continuous low permeability fines within the vadose zone and at the water table in the area of the proposed groundwater recharge area, the ERP survey indicated discontinuous lenses of low permeability units. Overall, the ERP survey suggests that there are significant permeable layers within the vadose zone that would allow successful recharge of water to the upper groundwater aquifer. This conclusion was supported by the results of the investigations discussed in Sections 2 and 3.

To illustrate these permeability connections using the existing information and new information collected during the field investigations, a three-dimensional (3D) model was developed using the software package Leapfrog. The 3D animation model was developed using the existing boring logs presented in the final work plan and the CPT logs, soil boring logs, and well logs developed for this investigation. The location of the soil borings and CPT points are shown on Figure 21. The location of ERP lines is shown on Figure 20.

**Figure 19. Figure 10 from Final Work Plan Showing Schematic Hydrostratigraphic Cross Section Using Existing Information**

**Figure 20. Fence Diagram Illustrating Results of ERP Survey Presented in Final Work Plan**

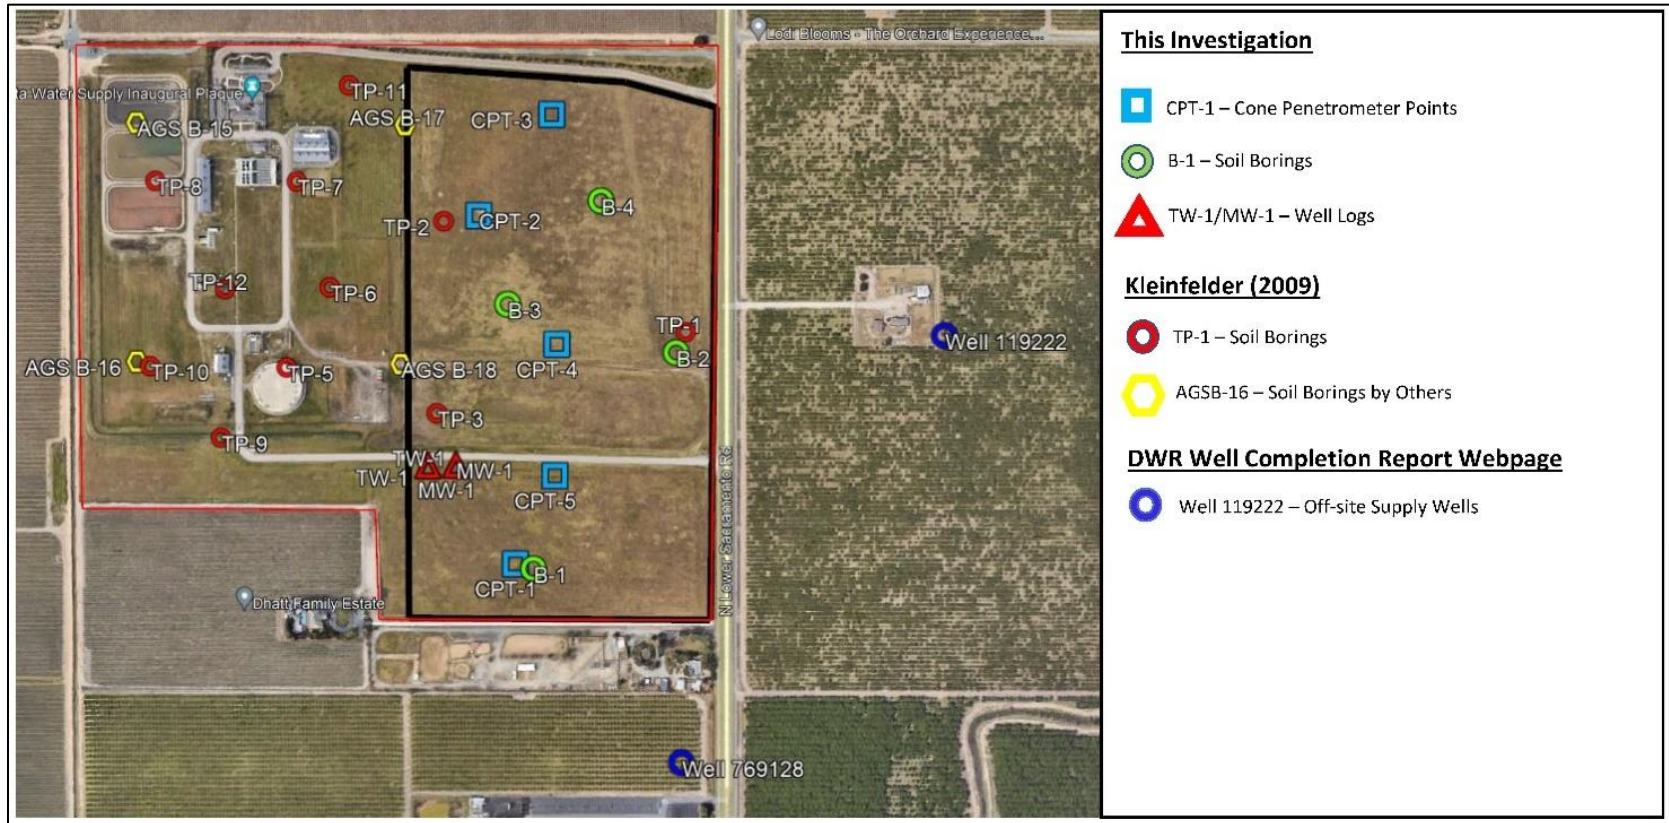

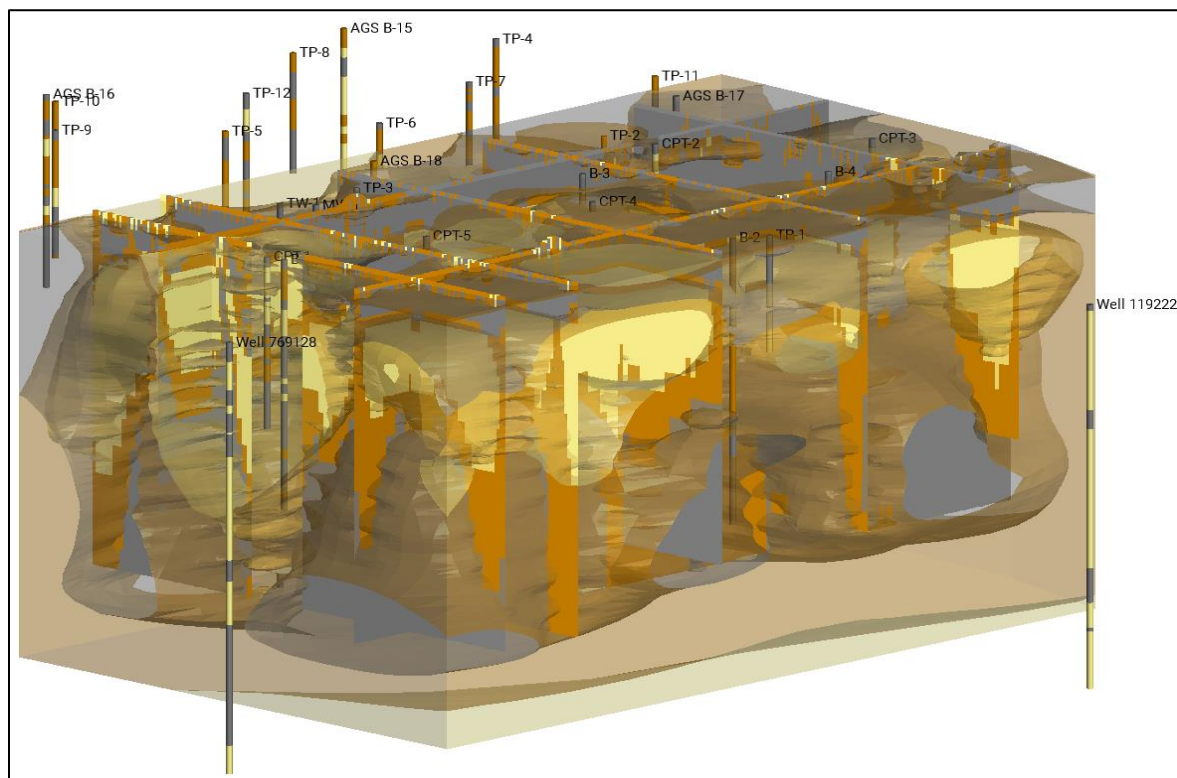

Figure 21. Location of Points Installed During this Investigation and Previous Investigations

To assess potential migration pathways to the east and south of the site, two well logs obtained from DWR's well completion website were included in the modeling. The locations of these wells are shown on Figure 21 and designated Well 769128 and 119222. Copies of these well logs are provided in Appendix C.

The modeling was based on resistivity values as follows:

- Less than 80 ohmmeters ( $\Omega$ -m)—low permeability fines
- Between 80 to 200  $\Omega$ -m—intermediate permeable silty sands
- Greater than 200  $\Omega$ -m—permeable sands and gravels

For the lithologic logs produced during drilling of soil borings and CPT points, fines were given a value 40  $\Omega$ -m, silty sands 150  $\Omega$ -m, and sands and gravels 500  $\Omega$ -m. Figure 22 provides still shots from the 3D animation showing the results of this modeling. These still shots show block diagrams illustrating the interbedded nature of the subunits and the apparent migration pathways for recharge water to move through the vadose zone to upper groundwater units. The blue plane in these diagrams is that approximate top of the groundwater surface. The bottom still shot focuses on the vadose zone with the fine-grained units (gray color) removed and illustrates the several pathways groundwater can migrate to the groundwater aquifers.

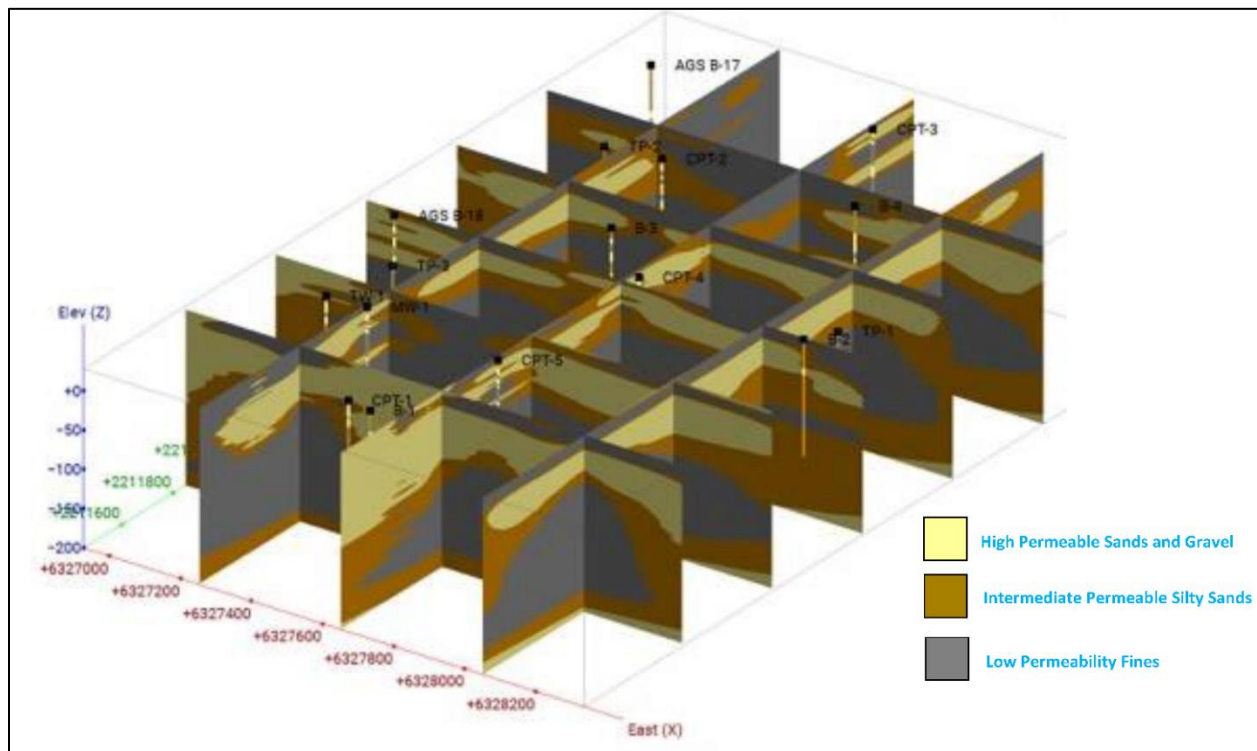

**Figure 22. Block Diagram Still Shot from Leapfrog 3D Animation**

Yellow areas are permeable sands and gravels, orange areas intermediate silty sands, and grey areas low permeability fines.

The 3D model was also used to construct cross sections. Figure 23 presents a fence diagram produced from the 3D model that further illustrates migration pathways for recharge water to migrate to the groundwater aquifer. This figure also better illustrates the presence of low permeability units at the surface of the proposed groundwater recharge that is discussed in more detail in Section 5.

In the localized area of the aquifer test conducted for this project, three aquifer zones were observed, a shallow localized perched zone (60 to 70 feet bgs), an intermediate aquifer (103 to 113 feet bgs), and a deep aquifer (150 to 180 feet bgs). The results of the aquifer test indicated these three zones in the vicinity of the aquifer test were not in direct hydraulic communication. However, responses to regional trends (Figure 15) suggested these unit were connected regionally. Both Figure 23 and Figure 24 support this connection whereby permeable units separated at the site appear to connect to the south, east, and west.

**Figure 23. Fence Diagram Created from 3D Leapfrog Model**

## 4.2 Site Hydrogeology

Static water levels in 2007 and 2008 as discussed in the final work plan ranged from 43 feet bgs to 47 feet bgs. Static water levels reported for this project ranged from 46 feet bgs to 51 feet bgs consistent with the earlier readings. Three separate aquifer units exist below at least portions of the site and although they do not have direct hydraulic communication, based on response to regional changes as discussed in Section 3.2.1, it is believed these units are connect in areas near the site along with the regional aquifer.

As discussed in Section 2.3 of the final work plan, aquifer testing conducted in the vicinity of the site reported hydraulic conductivity values from 0.049 feet/minute (71 ft/day) to 0.134 feet/minute (193 ft/day). Based on the HCM developed for the aquifer test, the Moench Case 3 solution has the best fit and had reported K values of 103 ft/day to 83 ft/day. The also provides a spreadsheet to estimate K values from grain size analysis. Using the grain size analysis conducted for a sample collected from 146 feet from MW-1 (Appendix E), the estimated K values using this method range from 3 ft/day to 63 ft/day, as summarized in Table 20. These values are within the range of values calculated from the aquifer tests and consistent with well sorted sands.

**Table 20. Estimation of K Values from Grain Size Analysis for Sample Collected at 146 feet bgs from MW-1 (from AQTESOLV™ User Manual)**

Data for Computing K from Grain Size Distribution

<sup>[2]</sup> Silts, sands, and gravelly sands				
<sup>[3]</sup> 0.06 mm ≤ D <sub>10</sub> ≤ 0.6 mm; 1 ≤ C <sub>U</sub> ≤ 20				
<sup>[4]</sup> 0.05 mm ≤ D <sub>10</sub> ≤ 0.83 mm; 0.09 mm ≤ D <sub>60</sub> ≤ 4.29 mm; 1.3 ≤ C <sub>U</sub> ≤ 18.3				

Infiltration rates reported during this investigation (Section 3.1) averaged between 1 to 4 ft/day although some areas had significantly higher rates greater than 100 ft/day. Significant portions of the upper 15 feet of the site have low infiltration rates whereas from 20 feet to the top of the groundwater zone has significant high permeable materials. These variations in permeabilities are discussed in more detail in Section 5.

### 4.3 Water Quality

Table 19 presents water quality data for samples collected during this investigation plus recharge source data provided by the City. As seen on this table, chloride and sulfate are below their respective secondary maximum contaminant levels (SMCL) of 250 mg/L with samples collected from the monitoring well and test well. Only the sample collected from TW-1 had a reported TDS

value (470 mg/L) below the SMCL whereas the samples collected from MW-1D, MW-1I, and MW-1S had reported values above the SMCL ranging from 670 mg/L to 900 mg/L. These values are still below the upper SMCL of 1,000 mg/L. Concentrations below the upper SMCL are acceptable if it is neither reasonable nor feasible to provide more suitable waters. All these constituents were below the recommended SMCLs for most of the supply wells near the site completed in the regional aquifer as discussed in Section 2.4 of the final work plan.

Only the most recent analysis of source samples provided by the City is included on Table 19. However, the City provided additional data for each of the sample locations. Table 21 provides selected parameters from this additional data that is used in the construction of figures discussed below. As seen on this table, TDS values for the source water samples were below 300 mg/L with most samples being below 100 mg/L.

**Table 21. Summary of Data for Selected Parameters from Source Water Samples Provided by City (mg/L)**

Abbreviations: Ca - calcium; Cl - chlorine; Fe - iron; HCO3 - bicarbonate; K - potassium; Mg - magnesium; Mn - manganese; Na - sodium; ND - no detection; SO4 - sulfate

To assess the general chemical analysis, the cations (metals such as calcium and sodium) and anions (such as chloride and sulfate) were plotted on piper diagrams. A piper diagram is a graphical representation of the chemistry found within a water sample or samples. As shown in Figure 24, piper diagrams are a combination cation triangle (lower left) and anion triangle (lower right) that lie on a common baseline. A diamond shape is placed between them. Information that can be assessed from this diagram includes water type, mixing of waters, and potential precipitation or solution (dissolving) of minerals.

As shown on Figure 24, four primary water types (colored circles on diamond) are designated on the piper diagram. Figure 25 shows the piper diagrams constructed using data collected for this project. As seen on this figure, the water type for all groundwater samples collected beneath site is calcium-bicarbonate. Calcium-bicarbonate are typical of shallow fresh groundwater consistent with where the samples were collected from and consistent with water types from samples collected from wells in the regions (see Section 2.4 and Figure 15 from final work plan). Although the classifications are for groundwater types, the surface water (source) samples have been included for comparison with the groundwater samples. As seen on these figures, most of the source water samples are sodium-bicarbonate water types that for groundwater would be typical of deeper groundwaters influenced by ion exchange. Other water types include calcium-

bicarbonate, magnesium-carbonate (similar to calcium-bicarbonate), and calcium-chloride. For the surface water samples, TDS and the individual cations/anions are very low.

Several constituents were detected above the maximum contaminant level (MCL) and SMCL as follows (Table 17):

- Arsenic was detected just above the MCL of 0.01 mg/L in the grab sample collected from CPT-1 (0.012 mg/L). In all other samples, including the well samples that are more representative of site conditions, arsenic was reported well below the MCL.
- Selenium was reported just above the MCL of 0.05 mg/L in the sample collected from well MW-1S (0.051 mg/L) with all other samples reported below this level.
- Iron was reported above the SMCL of 0.3 mg/L in five samples ranging from 0.42 mg/L (MW-1D) to 16 mg/L (CPT-2 at 65 feet bgs). MW-1D was the only well sample with iron above the SMCL.
- Manganese was reported above the SMCL of 0.05 mg/L in 7 of the 10 samples collected ranging from 0.073 mg/L (CPT-4 at 112 feet bgs) to 1.5 mg/L (CPT-1 at 65 feet bgs). All four samples collected from wells at the site had values above the SMCL.
- 1,2,3-TCP was detected above the MCL of 0.000005 mg/L in the sample collected from TW-1 (0.00013 mg/L).

#### 4.4 Update to HCM

The HCM presented in the final work plan indicated that based on existing information, soils beneath the proposed groundwater recharge area appear to be suitable for groundwater recharge with estimated infiltration rates between 1 to 2 acre-feet per day. The infiltration rates were based on percolation testing conducted for the sedimentation basin and leach fields located to the west of the proposed groundwater recharge area (see Figure 13 from final work plan). The ERP survey conducted before preparation of the final work plan suggested that there may be areas with higher infiltration rates. Results of previous soil borings and the ERP survey conducted as part of Task 3 also suggest that recharge water can migrate through the unsaturated zone down to the upper groundwater aquifer zone.

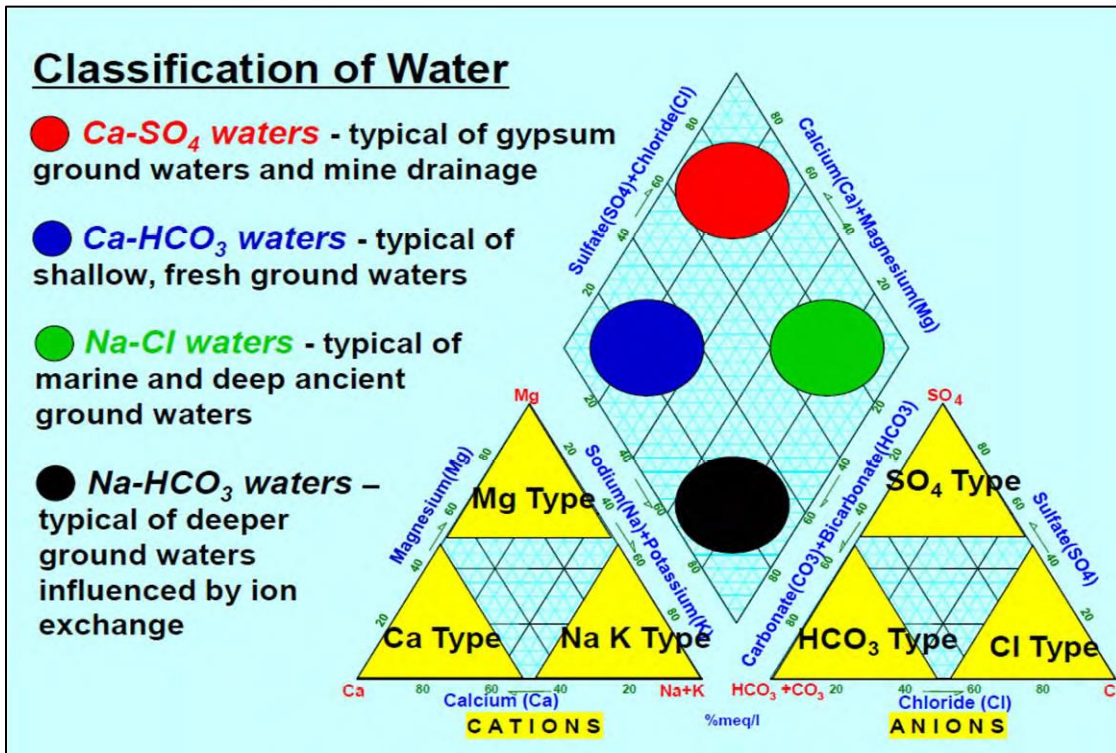

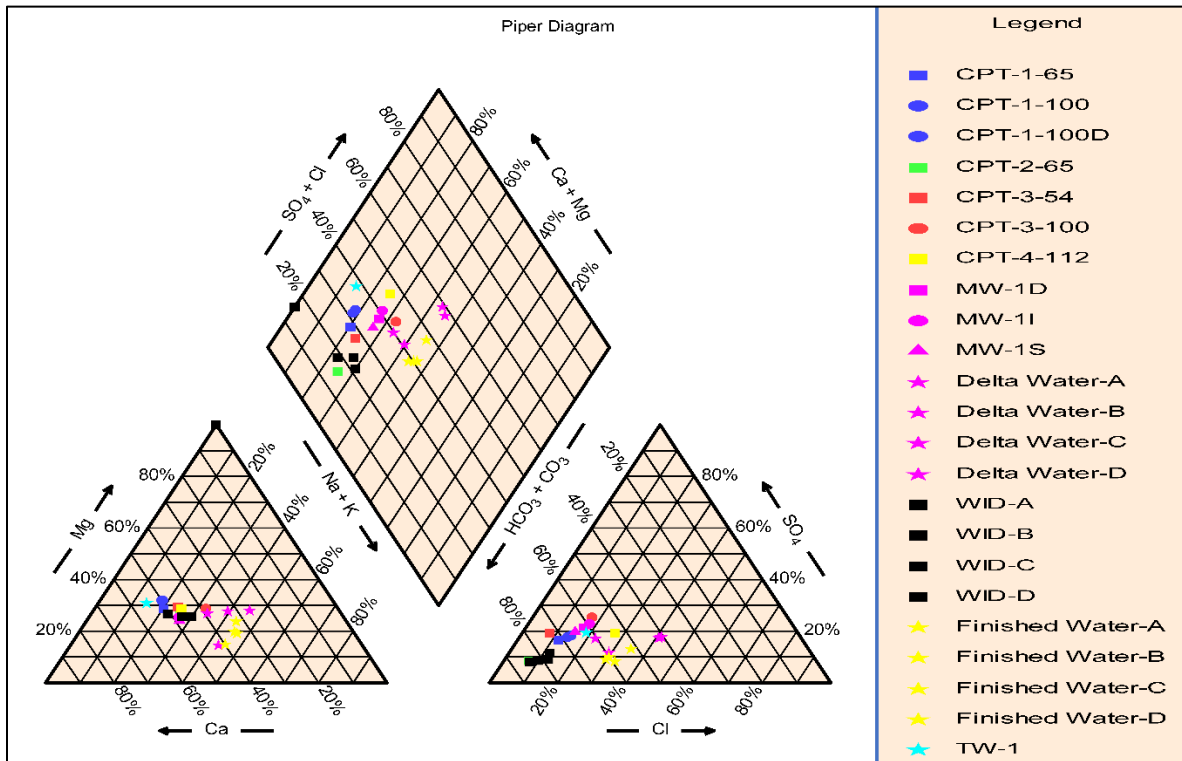

Figure 24. Outline of Piper Diagram Showing Water Classifications Developed for Cation and Anion Analysis

**Figure 25. Piper Diagram for Cation/Anion Results for Groundwater Samples Collected for this Project Plus Source Water Samples Provided by the City**

Although existing data and results of the ERP survey indicate that the proposed groundwater recharge project would be viable, only limited data have been collected directly beneath this site. In addition, the ERP survey is based on the electrical properties of soil types, and additional data are needed to confirm these results. As such, the following data gaps, or additional data needs, were identified that formed the basis of the field investigations described in Sections 2 and 3:

1. Site specific data are needed to confirm the results of the ERP survey.
2. Additional data are needed in areas not covered by the ERP survey to further assess the overall properties of the underlying soils.
3. Infiltration testing of the major soil types identified beneath the site are needed to confirm the limited testing that has been done, both laterally and vertically.
4. Site specific data are needed to confirm the actual depth to first encountered groundwater and anticipated aquifer properties.
5. Physical and chemical properties of the soil, upper groundwater aquifer directly beneath the site, and source water used for recharge are needed to assess current conditions and potential chemical interactions between soil, source water, and groundwater.

The data collected to complete these data gaps are discussed in Sections 4.1, 4.2, and 4.3 and are summarized below.

**4.4.1.1 Data Gaps 1 and 2—Confirm and expand upon results to ERP survey**

The results of the field investigations discussed in Sections 2 and 3 confirmed the ERP survey, whereby the soil borings and CPT points showed fines and coarser material consistent with the results of the ERP survey. Soil boring and CPT points were also completed between the ERP lines expanding the assessment of survey showing interbedded fines and coarse material. A more detailed discussion of the overall migration pathways for recharge water down to the groundwater table is presented in Section 5.

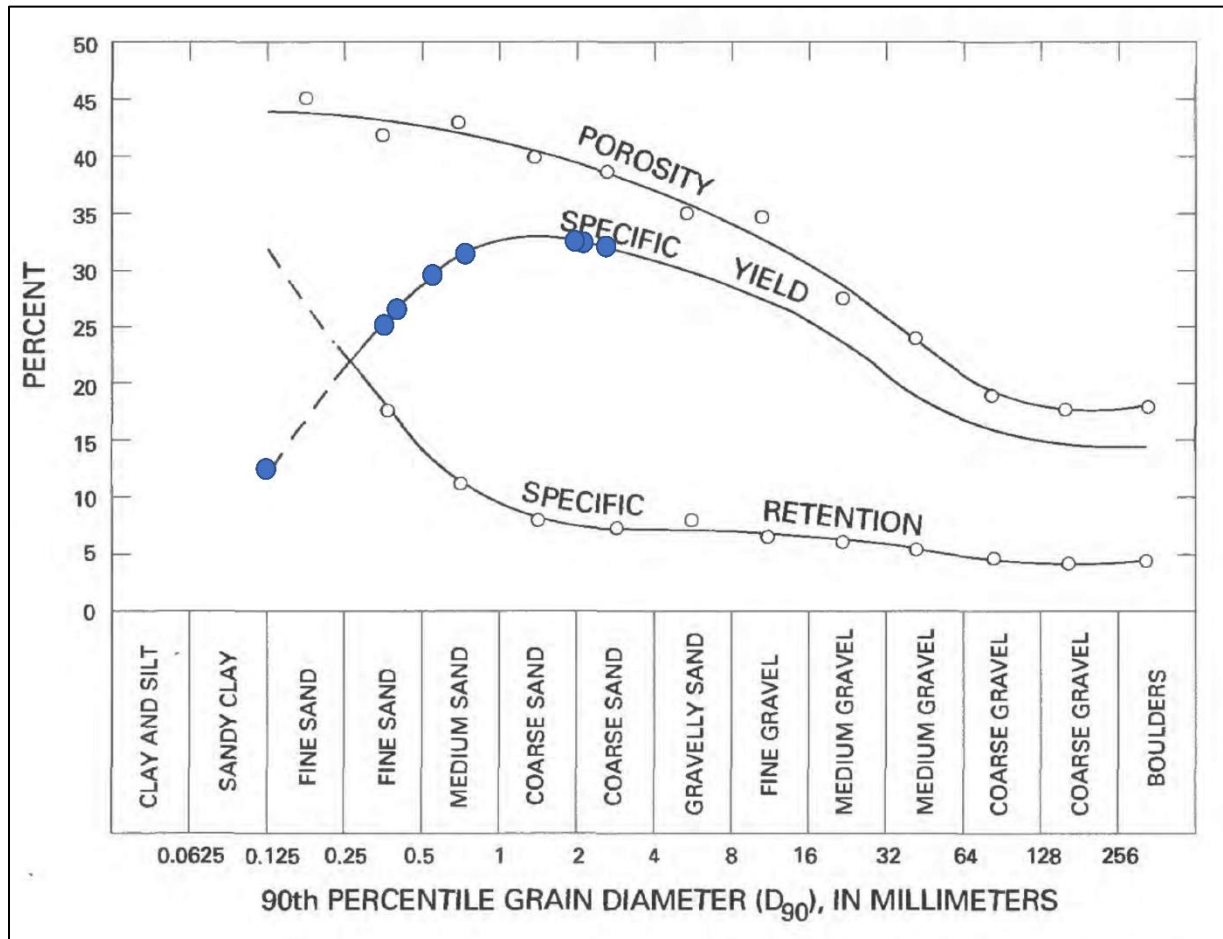

**4.4.1.2 Data Gap 3—Confirmation of infiltration rates**

As stated above, testing conducted at the site suggested potential infiltration rates for soils between 3 feet to 10 feet bgs and 1 to 2 ft/day. Infiltration rates reported during this investigation (Section 3.1) averaged between 1 to 4 ft/day, although some areas had significantly higher rates, greater than 100 ft/day. Significant portions of the upper 15 feet of the site have low infiltration rates, whereas from 20 feet to the top of the groundwater zone has significant high permeable materials. These variations in permeabilities are discussed in more detail in Section 5.

**4.4.1.3 Data Gap 4—Depth to groundwater and aquifer properties**

As discussed in Section 4.2 and summarized on Table 5 and Table 7 for static water levels collected prior to the aquifer testing, depth to first encountered groundwater ranged from 46 to 51 feet bgs. These measurements were collected in February and April of 2023 after significant rain events. Water levels recorded from the CPT program in October 2022 prior to the significant rain events ranged from 55 feet bgs to 59 feet bgs. The hydrograph for MW-1 presented on Figure 15 also shows that water levels rose more than 3 feet between February and April of 2023.

Aquifer properties were assessed from the aquifer testing with reported T values ranging from 1,000 to 5,000 ft<sup>2</sup>/day, K values ranging from 35 to 107 ft/day, and storativity (S) values ranging from 0.001 to 0.002 (unitless). K values are consistent with sorted sands. One of the objectives of the project was to estimate the specific yield (Sy) of the first encountered groundwater unit. The aquifer test was conducted in a semi-confined aquifer and estimates of Sy could not be assessed from these analyses. To provide a rough estimate of Sy for the first encountered groundwater unit, the graphical method from grain size analysis described by Robson (1993) was used. As stated by Robson (1993), these methods are informative for Sy but generally do not enable accurate estimations. Figure 26 shows the estimation of Sy using grain size analysis for samples collected from material similar to sands in the upper aquifer zone screened by MW-1S (Appendix E). As seen on this figure, Sy values range from 0.12 to 0.30. The estimated Sy value stated in the ESJGS GSP is 0.17. For this project, Sy for the sands within the upper aquifer zone are assumed to be between 0.17 to 0.25.

**Figure 26. Estimation of Sy Using Method Described by Robson (1993)**

Grain size samples from sands are similar to sands from the first aquifer zone (Appendix E).

**4.4.1.4 Data Gap 5—Chemical and physical properties of soil, groundwater, and recharge source water**

The results of chemical and physical testing conducted on soil and water samples are discussed in Sections 3.3 and 4.3. Physical testing soil samples included permeability testing, moisture content, grain size, and Atterberg limits and were consistent with results using other methods. Results of soil chemical testing (Table 16) did not identify any potential concerns for water quality and recharge water moves through these sediments.

The results of water quality testing for both groundwater and source water indicate good quality water and did not identify any potential concerns for changes to water quality from the mixing of these waters. Arsenic and selenium were detected in one sample each from the upper water unit just above their MCLs. Iron and manganese were detected above their SMCLs in several samples and 1,2,3-TCP was detected above the MCL in the samples collected from the test production well. These are existing constituents and the addition of recharge water using the source waters identified will most likely improve these existing water quality conditions.

As indicated above, the results of the field investigations confirm that the soils beneath the proposed groundwater recharge area appear to be suitable for groundwater recharge. Surface soils down to 15 feet have lower permeabilities but soils from 20 feet bgs to first encountered groundwater at about 50 feet bgs appear to have high permeabilities. A successful recharge program needs to address the lower upper surface permeabilities and maximize the amount of infiltrated water to permeable soils at 20 feet bgs. Although data indicate there are localized perched water systems beneath the site, these perching layers are discontinuous at recharged water hitting these zones can migrate along preferential pathways to the regional shallow aquifer. Nearby wells completed in this upper aquifer zone are reported to produce in excess of 5,000 gpm, indicating that recharged water can be extracted near the site. However, it is our understanding that the City will extract water from existing supplies wells located off-site. Results of water quality did not identify any potential issues created by recharging surface water; however, there are existing groundwater quality issues. It is anticipated that results of recharging water to these areas would improve these water quality issues.

## 5. FEASIBILITY ANALYSIS

The primary objective of this project is to evaluate the feasibility of using a portion of the DWTP facility for groundwater recharge and, if feasible, provide a preliminary design for the recharge basin. Specifically, the feasibility analysis includes the following information:

- Suitability to recharge surface-applied water in terms of ft/day over the site and an estimate of the annual quantity of water capable of being recharged to the underlying groundwater basin
- Potential for groundwater recovery in terms of millions of gallons per day or acre-feet per year
- Recommendation for monitoring groundwater movement to determine the volume of water recharged and available for recovery without negatively impacting the groundwater basin and/or nearby private (or public) wells
- Potential impacts to groundwater quality related to recharge operations
- Preliminary basin layout that considers the existing surface water delivery locations and how water is best distributed and managed across the site
- Estimate of probable design and construction cost
- Environmental clearance requirements
- Permitting requirements
- Operation and maintenance recommendations

As discussed in Section 1.1, the preliminary basin layout and estimate of probable costs are being submitted under separate cover that also includes recommendations for monitoring programs to assess recharge and potential impacts, permitting requirements, environmental clearance requirements, and operation and maintenance requirements.

### 5.1 Suitability for Recharge/Estimate of Annual Recharge Capacity

Soils beneath the proposed groundwater recharge area appear to be suitable for groundwater recharge. However, surface soils down to 15 feet have lower permeabilities that could limit the ability to maximize the amount of water that can be recharged annually. To illustrate the change in overall permeabilities from shallow soils to deeper soils, depth layers from the 3D model were constructed as illustrated on Figure 27. Each layer shows the distribution of high permeable soils (yellow), intermediate permeable soils (orange), and low permeable soils (gray). The blue layer shows the approximate depth to first encountered groundwater at 50 feet. Copies of each these layers are provided in Appendix H.

As shown on Figure 27 and Appendix H, the percentage of low permeability soils within the upper 15 feet range from 65% to 70%, whereas from 20 feet bgs to 50 feet bgs, the high permeable soils are greater than 50%. As discussed in Preliminary Design report submitted under separate cover, our proposed preliminary design for the recharge facility includes three separate pond areas ranging in size from 13.5 acres (Pond 3) to 15.7 acres (Pond 2) for a total recharge area of about

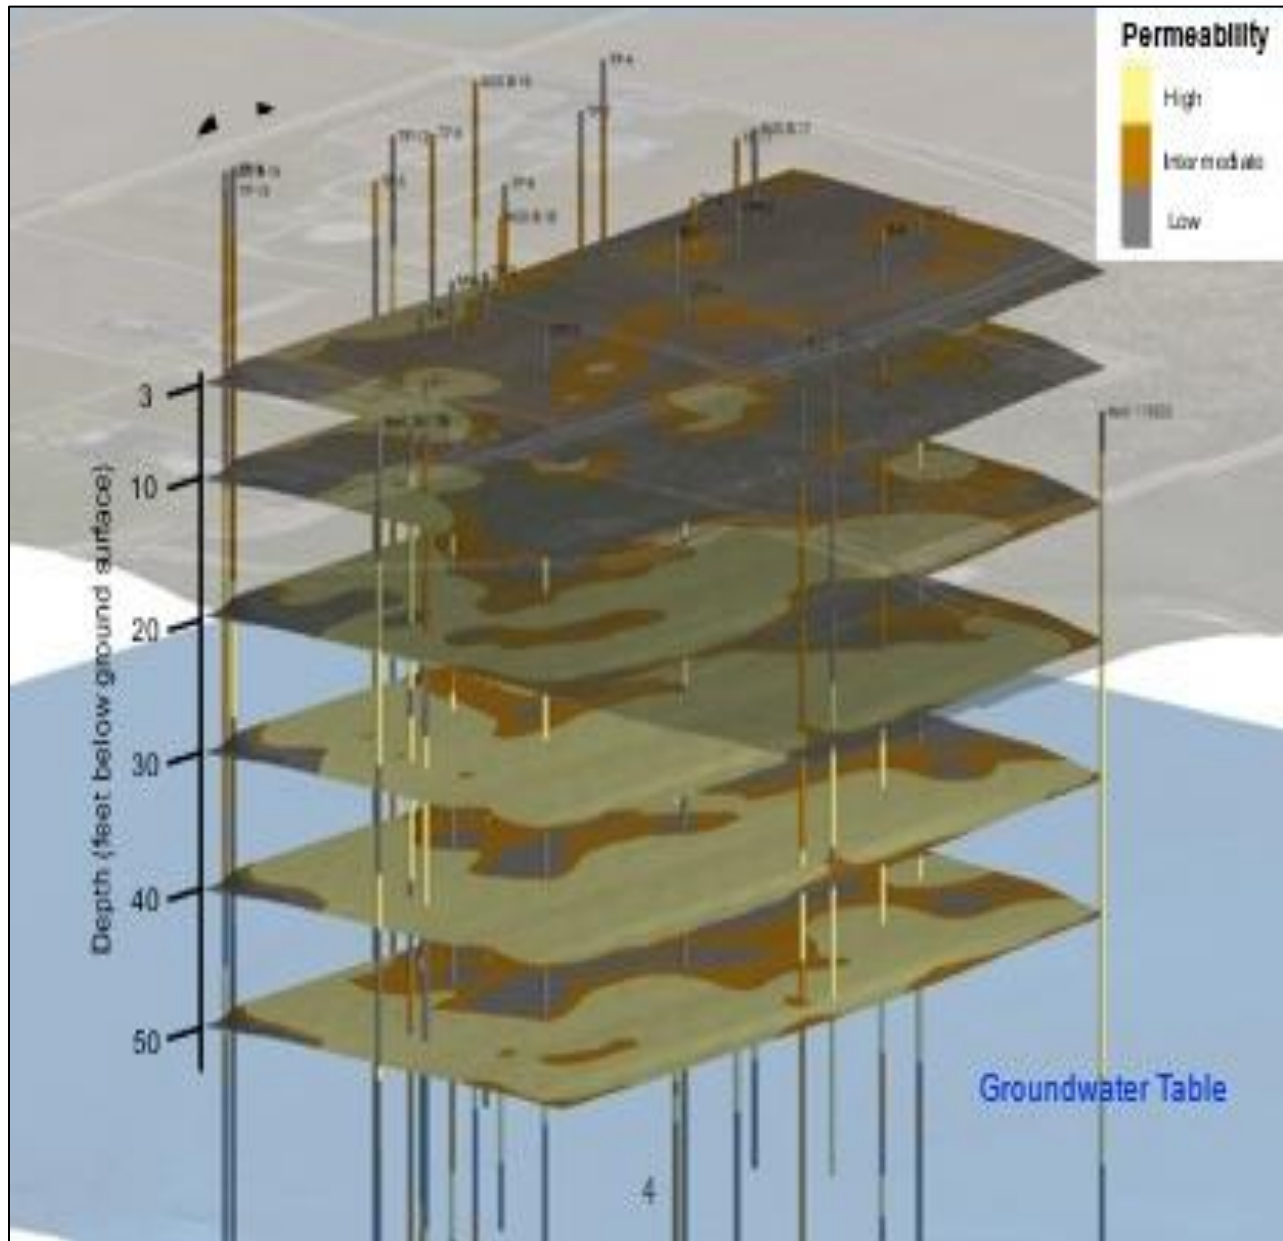

43.5 acres. The proposed design for each pond is to excavate soils to 3 feet bgs. To estimate the annual recharge capacity from this excavation depth, uniform  $K_v$  values were assigned to each layer based on the average of the estimated  $K$  values within the three soil zones described above as follows:

- High permeable soils— $K_v = 3$  ft/day
- Intermediate permeable soils— $K_v = 1.5$  ft/day
- Low permeable soils— $K_v = 0.2$  ft/day

These  $K$  values were based on the lower range of values calculated from the various methods to estimate infiltration rates. The average  $K_v$  values for the 3-foot depth plus the other depth interval slices are summarized in Table 22. To estimate the volume of water that could infiltrate directly from this depth, the harmonic mean for the upper 10 feet for  $K_v$  values was used. Using these values, the estimated volume that can directly infiltrated is 11,490 acre-feet per year as summarized on Table 23.

The City has up to 22,000 acre-feet available annually for recharge. Assuming 335 days for recharge in the basin, this volume would require an average infiltrate rate of about 1.44 ft/day. To account for this volume of water, the recharge program needs to include and maximize the amount of infiltrated water directly to the permeable soils at 20 feet where the harmonic mean for  $K_v$  values between 20 feet bgs to 50 feet bgs range from 1.73 ft/day (Pond 2) to 3.06 ft/day (Pond 3). As such, the proposed design includes installation of large diameter vertical infiltration slotted wells placed in areas with high permeabilities to depths of 20 to 25 feet bgs. These wells would be placed in large diameter borings filled with gravel to maximize the amount of water that can directed to these depths. In addition, gravel filled trenches sloped toward these wells will also be constructed to allow water to flow towards these areas. This design is shown and a more detail in Preliminary Design Report submitted concurrently with this report. The  $K_v$  values used are believed to conservatively low and higher infiltration may occur. Also, once saturated conditions occur, higher rates may occur based on the  $K_h$  values observed at the site.

As discussed in Section 4, locally, first water beneath the site occurs within a perched groundwater system. However, the perching zone appears to pinch out and infiltrated water should reach the regional shallow aquifer that extends to about 200 feet bgs. As such, it is difficult to estimate the amount of mounding that will occur, but the specific yield values suggest that is sufficient storage capacity to accept the volume of recharged water.

**Figure 27. Depth Layers from 3D Model Showing Percentage of High Permeable, Intermediate Permeable, and Low Permeable Soils Beneath Proposed Groundwater Recharge Area**

**Table 23. Estimated Infiltration Capacity of Proposed Groundwater Recharge Basins**

Pond	Area (square feet)	Average Infiltration Rate <sup>[1]</sup> (ft/day)	Number of Days	Volume per Day (acre-feet)	Volume per Year (acre-feet)
1	622,908	0.61	335	8.72	3,398
2	683,892	0.56	335	8.79	2,896
3	588,060	1.15	335	15.53	5,196
<b>Total</b>				<b>33.04</b>	<b>11,068</b>

Note: <sup>[1]</sup> Infiltration rate is the harmonic mean of values calculated between 3 feet bgs and 10 feet bgs, as shown on Table 19.

## 5.2 Potential for Groundwater Recovery

The City will use existing supply wells in the vicinity of the site to recover recharged water. However, as discussed in Section 4.4, an adjacent supply well within the upper aquifer can produce in excess of 5,000 gpm, indicating that wells could be placed near the site that can recover the recharged water.

## 5.3 Potential Impacts to Groundwater Quality

The source water that will be used for groundwater recharge is of very good quality and is not expected to cause potential impacts to the existing groundwater quality. The results of soil chemical testing also indicate that no impacts to groundwater should occur from the leaching of constituents during infiltration through this material.

As discussed previously, 1,2,3-TCP was reported above the MCL in one sample. In addition, the metals selenium and arsenic were detected above the MCL in one sample each and iron and

manganese were detected above their SMCLs in several samples. Although additional testing is recommended for these constituents, as discussed in Section 4.4.1.4, it is anticipated that the infiltrated water that does not contain these constituents will reduce the overall concentrations over time.

## **APPENDIX A**

### **Task 3 Memorandum – ERP Survey Report**

October 14, 2022

Mr. Danny Trejo  
Project Manager III  
Municipal Utilities Department  
Delta Water Treatment Plant  
11373 N. Lower Sacramento RD  
Lodi, CA 95242

**SUBJECT:** Final Electrical Resistivity Profile Survey Report, DWTP Groundwater Recharge Improvements Project, Task 3, PO No. 422000858

Dear Mr. Trejo

Please find attached the Final Geophysical Report prepared by Norcal Geophysical Consultants, Inc. (Norcal). This report presents the results of the electrical resistivity survey (ERP) conducted as part of Task 3 for Purchase Order No. 422000858, Delta Water Treatment Plant (DWTP) Groundwater Recharge Improvements Project. Figure 1 shows the location of the DWTP. A description of services during this reporting period are summarized below.

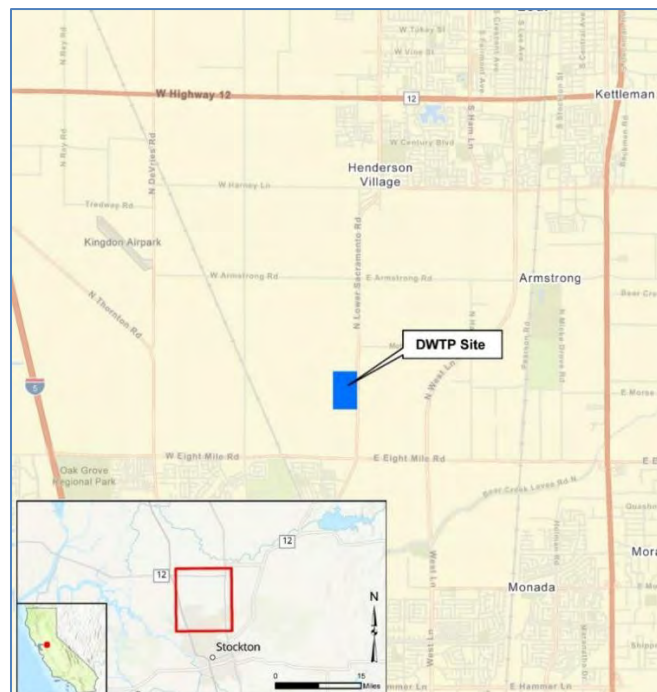

Figure 1. Location of DWTP

Mr. Trejo  
October 14, 2022  
Page 2

Electrical resistivity profiling measures subsurface electrical properties related to lithologic variations. The apparent resistivity of subsurface material is determined by transmitting electrical current into the ground through metal electrodes placed along a traverse and measuring the resulting voltage. Seven lines were run at the locations depicted in Plate 1 of the attached Norcal Report. A more detailed discussion of the results of this survey as it relates to the overall project are provided in the Draft Work Plan provided to the City of Stockton on 11 October 2022.

The geophysical survey was conducted during the period July 27, 2022, through August 5, 2022. Photographs from field activities are provided below.

*Photographs. Left photograph shows setup for data acquisition equipment with right photographs showing power source for the survey.*

Mr. Trejo

Delta Water Treatment Plant  
Groundwater Recharge Basin Improvements Project  
San Joaquin County, California

NORCAL Project No. NS225020

Attention: Mr. Joe Turner:

Dear Mr. Turner:

This report presents the findings of an electrical resistivity profiling (ERP) survey performed by NORCAL Geophysical Consultants, Inc. for Geosyntec Consultants, Inc. (Geosyntec) for the Delta Water Treatment Plant's Groundwater Recharge Basin Improvements Project, San Joaquin County, California. The work was authorized under Geosyntec Work Order 100038307, dated July 20, 2022. NORCAL Professional Geophysicists David T. Hagin (CA PGp No. 1033) and Hunter S. Philson (CA PGp No. 1094), Staff Geophysicist J. Sage Wagner and Field Geophysical Technicians Matthew Hartsfield and Eric McArthur performed the survey during the period July 27 through August 5, 2022.

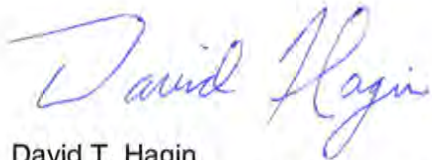

The scope of NORCAL's services for this project consisted of using geophysical methods to characterize the subsurface. The accuracy of our findings is subject to specific site conditions and limitations inherent to the techniques used. We performed our services in a manner consistent with the standard of care ordinarily exercised by members of the profession currently employing similar methods. No warranty, with respect to the performance of services or products delivered under this agreement, expressed or implied, is made by NORCAL.

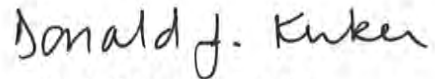

We appreciate having the opportunity to provide our services for this project. If you have any questions or require additional geophysical services, please do not hesitate to call on us.

Sincerely,

**NORCAL Geophysical Consultants, Inc.**

**Geophysical Report**  
**Electrical Resistivity Profiling Survey**  
**Delta Water Treatment Plant**  
**Groundwater Recharge Basin Improvements Project**  
**San Joaquin County, California**  
September 9, 2022

**1.0 INTRODUCTION**

Considering the groundwater shortage currently being experienced in California’s Central Valley, the Delta Water Treatment Plant (DWTP) is incorporating a groundwater recharge program into their development plan. Part of this program involves creating basins or other structures into which captured stormwater will be directed to provide a source for groundwater recharge. Consequently, it is desired to find locations adequate to recharge subsurface aquifers within the underlying sedimentary layers. However, for the captured meteoric waters to penetrate the deeper subsurface, the local sedimentary deposits must have sufficient groundwater permeability to adequate depths.

This report presents the results of an electrical resistivity profiling (ERP) survey performed to aid in determining the location(s) of higher permeability deposits within the subsurface to depths of approximately two-hundred feet. The ERP method provides a general characterization of the subsurface conditions based on variations in the electrical properties, and can indicate the locations of fine-grained versus coarse-grained sedimentary deposits. Generally, more coarse-grained deposits are associated with higher groundwater permeability.

**2.0 SITE CONDITIONS**

The following description of site conditions is derived from our site visit and a review of publicly available geologic and topographic maps, as well as information from Geosyntec and DWTP personnel.

Item	Description
<b>Site information</b>	The area of investigation lies directly west of North Lower Sacramento Road, spanning approximately 67-acres between the road and the DWTP facility structures. The coordinates of the center of the survey area are approximately: (38°04'08.1"N 121°18'46.6"W).

Item	Description
<b>Existing improvements</b>	The survey area has no surficial improvements other than two roadways and surrounding fences. Based on our observations, it is believed that an underground pipe transects the site approximately 380-ft north of the southern road.
<b>Existing topography</b>	Based on our Trimble Geo7X GPS and Google Earth data, the survey area topography is generally flat, with an average ground surface elevation of about 25-ft (NAVD88).
<b>Site geology</b>	Available geologic maps (USGS, 2008; CGS 2010) indicate that surficial geology consists of Quaternary alluvial deposits. Based on communications with Geosyntec personnel, is our understanding that the shallow subsurface geology consists of largely alluvial or lacustrine sedimentary deposits.

### 3.0 SCOPE OF WORK

The ERP survey consisted of acquiring data along seven transects (lines), as directed by Geosyntec. The lines were positioned in a grid pattern throughout the survey area. The purpose for this positioning was to locate optimal areas for groundwater recharge within the available parcel. Aerial photographic imagery showing the site vicinity and the locations of these lines is presented on **Plate 1 – Site Location Map**. The labeled line locations are shown in blue, as indicated in the legend.

To provide documentation of our investigation, this report includes details of the instrumentation used, the data acquisition and processing procedures, as well as presentation of the resulting electrical resistivity profiles. We also offer our interpretations of the profiles and recommendations regarding the optimal locations for further invasive exploration based on the ERP data.

### 4.0 ERP SURVEY

#### 4.1 ERP METHODOLOGY

The ERP method is used to depict the electrical structure of the subsurface. Electrical resistivity (ER) is defined as “the resistance of a volume of material to the flow of electricity,” and is the inverse of conductivity. The method measures and quantifies ER values within earth materials. These values are presented as a two-dimensional (2-D) image, or profile, of the subsurface ER structure. The measured ER values are herein denoted by the Greek symbol  $\rho$  (rho) and are presented in ohm-meters ( $\Omega$ -m).

The  $\rho$  values within rock are typically higher than in sediments, primarily due to lower moisture content within the rock. Within fresh-water sedimentary deposits, moisture content and grain size

tend to control  $\rho$  values. Higher fine-grained fractions and higher moisture content within earth materials produce lower  $\rho$  values, which is to say that they are more electrically conductive. Conversely, coarse-grained materials such as sand and gravel produce higher  $\rho$  values and typically exhibit an increase in permeability.

Detailed descriptions of ERP methodology, the instrumentation we used, our data acquisition, analysis and interpretation procedures as well as the general limitations of the method are provided in **Appendix A – Electrical Resistivity Profiling Survey**.

## 4.2 ERP DATA ACQUISITION PARAMETERS

We acquired ERP data along seven transects denoted as Lines ERP-1, through -7, as shown in blue on Plate 1. The transect lengths were 2190-, 2145-, 1230-, 1230-, 1230-, 1335 and 1320-ft, respectively. The transect locations were determined jointly by NORCAL and Geosyntec personnel.

Data were collected using arrays of up to 56 stainless steel electrode spikes inserted into the ground at 15-ft intervals, yielding a “spread” length of 825-ft. To achieve the longer lines, we employed a “roll along” technique, as detailed in Appendix A. The depth of exploration is based on the ER structure of the sub-surface and the length of the ERP spread. The maximum depth is estimated at 200-ft for all the ERP lines.

## 4.3 ERP PROFILES

The results of inversion modeling are illustrated by the color contoured pseudo cross-sections (profiles) shown on **Plates 2 through 6 – Electrical Resistivity Profiles**. The profiles depict variations in  $\rho$  values both laterally and with depth beneath each line. On each profile, the horizontal axis represents the stationing, based on a zero-value established at the southern or western end of the line and the vertical axis represents elevation (NAVD88). The unit of measure for both axes is distance in feet. The  $\rho$  values are represented by the color-shaded, logarithmically distributed contours according to the color bar shown at the bottom of each plate. The black line along the top of the contours represents the ground surface.

## 5.0 RESULTS

### 5.1 ELECTRICAL RESISTIVITY VALUES

Based on our experience in similar freshwater sedimentary depositional environments, we herein establish three zones within the measured range of  $\rho$  values. Low values range between approximately 5 and 20  $\Omega$ -m (blue), and are interpreted to consist mostly of fine-grained deposits

such as silts and clays that typically exhibit low groundwater permeability. Moderate values range from 20 to about 100  $\Omega$ -m (green, yellow), and are considered transitional between fine- and coarse-grained materials. Generally, we expect permeability to increase with  $\rho$  values; however, these values do not represent the optimal targets for groundwater recharge. High  $\rho$  values range from 100 to approximately 1000  $\Omega$ -m (orange, red), and likely consist predominantly of coarse-grained materials such as sands and gravels with relatively high permeability.

## 5.2 ELECTRICAL RESISTIVITY PROFILES

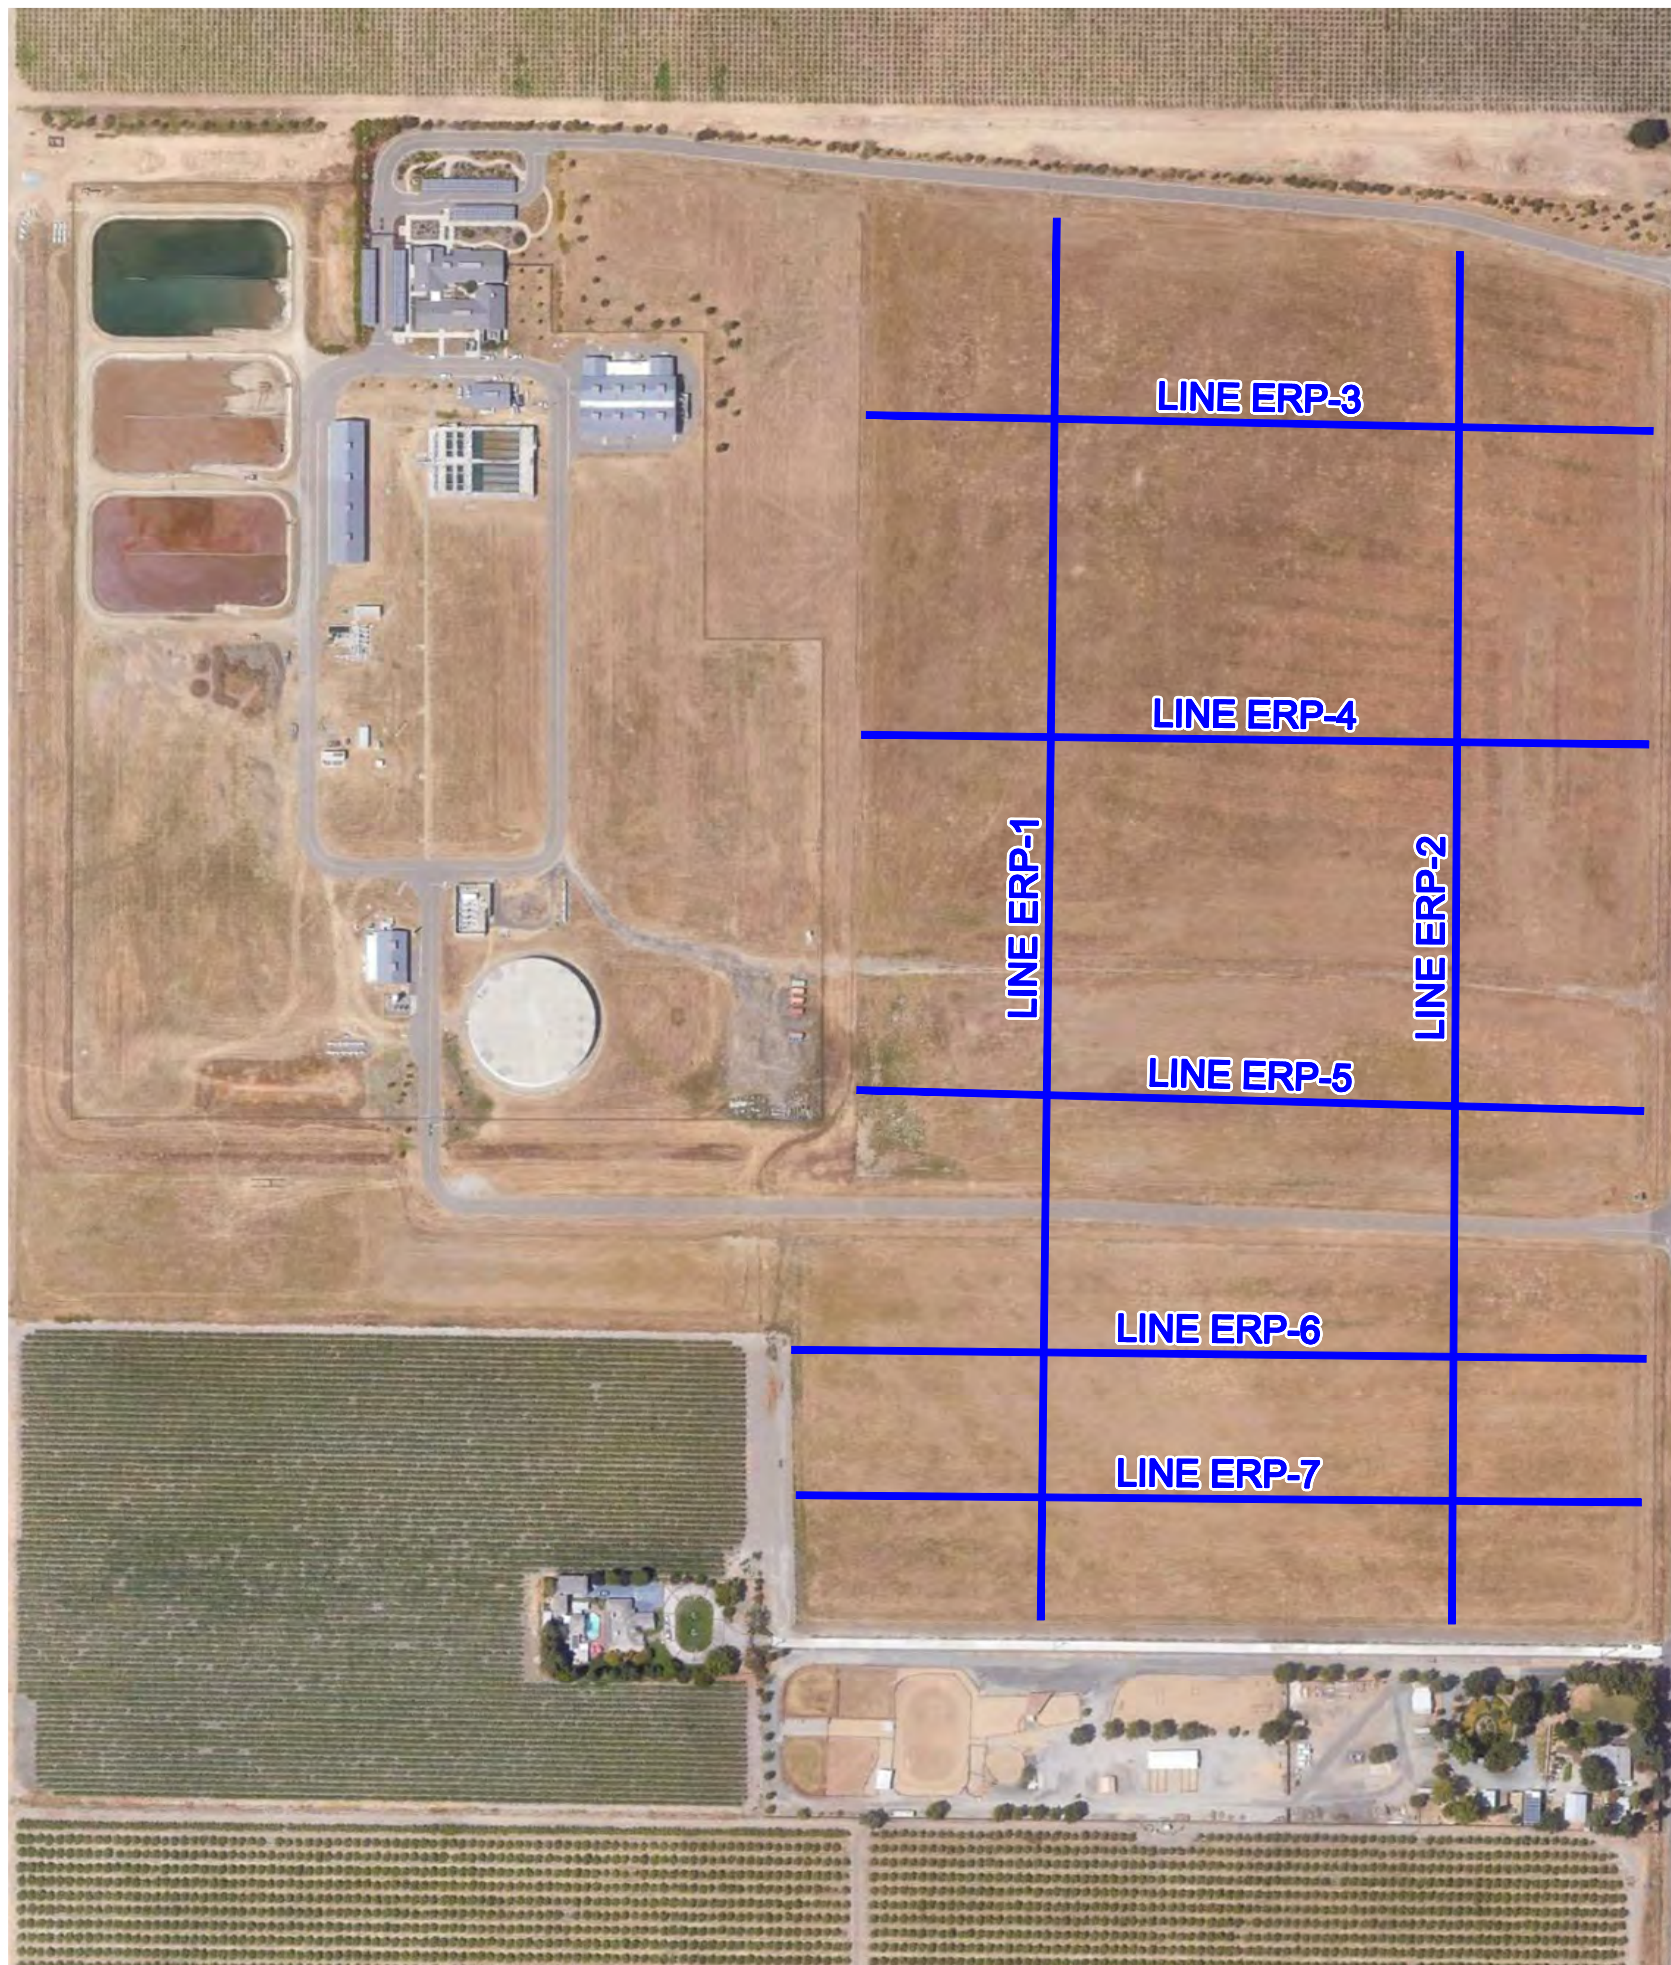

The overall appearance of the ERP profiles is as a two-layered model with a semi-continuous surficial high  $\rho$  layer that ranges from being absent in some areas to as thick as 100-ft in others, generally thickening toward the south. As noted in Section 5.1, these values likely represent largely coarse-grained deposits such as sands and gravels. Areas with this high  $\rho$  layer are apparent, to some degree, on all the profiles. This indicates that promising groundwater recharge opportunities within the upper 50- to 100-ft appear over larger portions of the site, as shown by the thicker and higher  $\rho$  (redder) portions of this layer. However, in some locations a thin surficial layer of low to moderate  $\rho$  values (green, blue) may decrease infiltration rates, and should be avoided.

In some locations, however, this layer appears to thicken significantly and extends to the bottom of the profile. It is in these areas that recharge of the deeper groundwater aquifers appears most optimal. These thicker areas are mostly on the southern and eastern portions of the site, but a few are also centrally located. The optimal locations for deep groundwater recharge, as indicated by the profiles, are where we see *continuous* high  $\rho$  values (yellow to red) that extend from the surface to deeper within the profiles. A strong example of this is centrally located on ERP-7, but also to some degree on the central and southern portions of ERP-2, the western end of ERP-4 and possibly the eastern end of ERP-5. There are other locations that show deeper high  $\rho$  zones, such as the northern half of ERP-1, that do not appear to be continuous with the surficial layers, and thus may not be optimally recharged by infiltration at or near the surface. We also note relatively large low  $\rho$  zones (blue) at depth, which suggest fine-grained deposits that may act as aquitards, considerably reducing groundwater flow rates.

## 6.0 DISCUSSION

Overall, the ERP survey indicates good potential for groundwater recharge within the upper 50- to 100-ft of the subsurface, as indicated by the high  $\rho$  values (orange, red), that suggest largely coarser-grained sands and gravels with relatively high permeability. Additionally, recharge of deeper aquifers may be possible where we see high  $\rho$  values that extend from the surface to deeper within the profiles, as detailed in Section 5.2. Also, we note good correlation between lines at the cross-points.

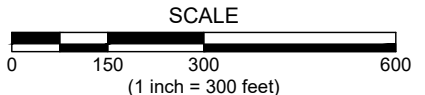

The ERP data may help to identify the optimal areas for the placement of groundwater recharge basins. However, as the interpretations contained herein are based solely on the measured  $\rho$  values, we suggest that further invasive exploration be completed in the areas of interest as a “ground truth” investigation. We recommend drilling and sampling in the various locations described in Section 5.2 as likely coarse-grained, higher permeability deposits based on the higher  $\rho$  values, with consideration of the desire to recharge shallower or deeper aquifers.

**APPENDIX A:**  
**Electrical Resistivity Profiling**

# APPENDIX A:

## Electrical Resistivity Profiling

### 1.0 METHODOLOGY

#### 1.1 ELECTRICAL RESISTIVITY: DEFINITION AND APPLICATIONS

Electrical resistivity (ER) is the resistance of a volume of material to the flow of electrical current. The ER method is often used to measure the variation in ER with depth beneath a fixed point or along a line. This information can be valuable in determining stratigraphic and lithologic variations and other subsurface conditions that may relate to the depth and thickness of groundwater aquifers and permeable layers, the thickness of landfills, and in some cases, the depth to bedrock.

#### 1.2 ELECTRICAL RESISTIVITY PROFILING

There are many electrode configurations (arrays) that can be used to measure ER beneath a line, commonly referred to as Electrical Resistivity Profiling (ERP). For this survey, we used one of the most commonly used configurations, the dipole-dipole array. In its simplest form, this consists of four electrodes distributed at even intervals in a collinear fashion. For each reading, electrical current ( $I$ ) is input to the ground through one pair of electrodes (transmitter dipole) and the resulting potential drop ( $V$ ) is measured across a second pair of electrodes (receiver dipole). The separation between electrodes ( $a$ ) is the same for both dipoles and the separation between dipoles is always a multiple ( $n$ ) of that distance. A simplified diagram of the dipole-dipole array is shown in Figure 1.

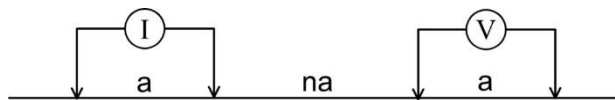

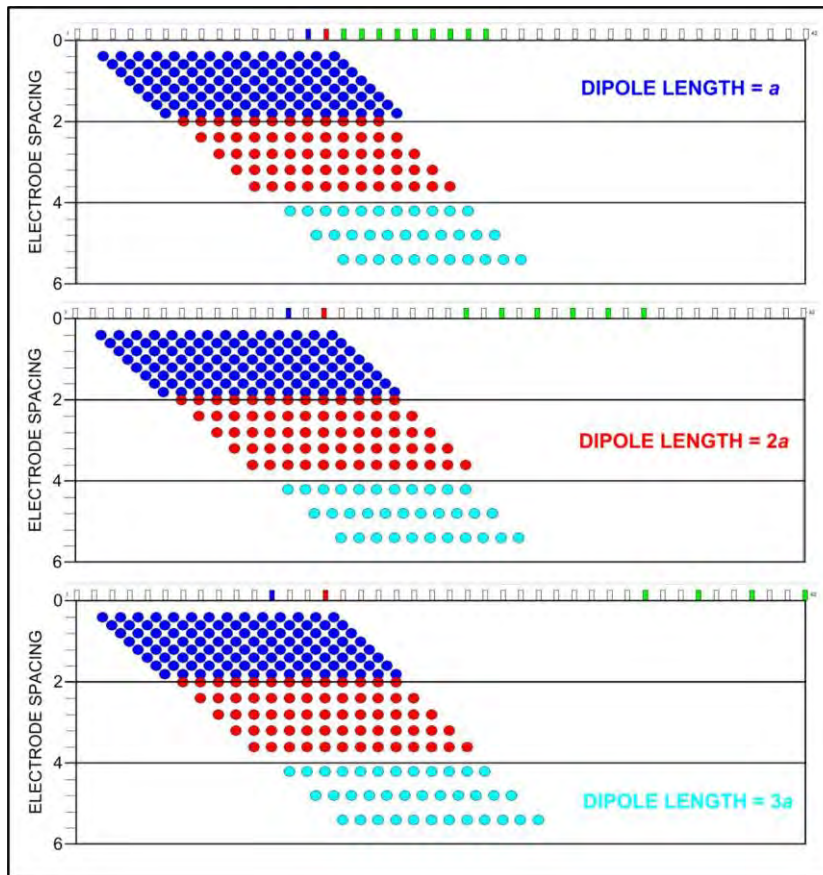

Figure 1: Dipole-Dipole Array Diagram

The values measured using this configuration are termed “apparent” resistivity ( $\rho_a$ ) because they represent the resistance to the flow of electricity of a volume of material rather than a discrete layer. With the dipole-dipole array, apparent resistivity is calculated according to the following equation:

$$\rho_A = \frac{V}{I} \pi a n(n+1)(n+2).$$

Moving the array along a line and measuring  $\rho_A$  at even intervals (multiples of  $\mathbf{a}$ ) results in a data set that can be used to construct a cross-section (profile) depicting variations in ER versus depth and distance. The depth of investigation of the profile can be increased by increasing both  $\mathbf{a}$  and  $\mathbf{n}$  by even multiples of  $\mathbf{a}$ .

Modern geophysical instrumentation makes it possible to collect dipole-dipole data using a large number of closely spaced electrodes and a wide range of  $\mathbf{a}$  and  $\mathbf{n}$  values. An example of how dipole-dipole data are obtained is illustrated by the three dipole-dipole diagrams shown in Figure 2. The rectangles at the top of each diagram represent electrode locations (42 in this case). The red and blue rectangles represent the transmitter dipole used for a particular measurement and the green rectangles represent the electrodes used as receiver dipoles for that measurement. The dark blue circles represent the data points obtained when the dipole length ( $\mathbf{l}$ ) is equal to the electrode separation ( $\mathbf{a}$ ), the red circles represent data points obtained when  $\mathbf{l}$  is equal to  $2\mathbf{a}$  and the light blue circles represent the data points obtained when  $\mathbf{l}$  is equal to  $3\mathbf{a}$ . In each diagram, the farthest right (diagonal) column of circles represents data points obtained from the active (colored) dipoles shown at the top of the diagram. Note how the matrix of data points is being filled-in from left to right and top to bottom with each successive diagram. Note also that as the dipole length and spacing increases the depth of investigation also increases but with a corresponding decrease in resolution.

**Figure 2:** Dipole-dipole diagrams for dipole lengths of 1, 2, and 3 times the electrode separation ( $a$ ).

## 2.0 INSTRUMENTATION

We collected the ERI data using a **SuperSting R8** resistivity meter (Figure 3). This system is typically configured with a 56-electrode switch box, four cables with 14 connectors (take-outs) per cable, and 56 stainless-steel electrodes. The instrumentation and cables comprising this system were manufactured by Advanced Geosciences Incorporated (AGI).

The SuperSting R8 is a micro-processor controlled instrument that transmits current at outputs ranging from 1 to 2,000 milliamps (mA). The instrument measures the potential drop (voltage) caused by the current influx and converts the data to values of apparent resistivity. A command file programmed into the instrument directs the switch box to activate certain electrodes for each reading according to the selected electrode configuration and many other parameters that are

determined by the operator. The resulting data are stored in the instruments internal memory and can be downloaded to a computer for subsequent processing and archival.

**Figure 3:** *SuperSting R8 (yellow box), two 56-electrode switch boxes (black), WiFi tablet (foreground) and two communication cables on reels.*

### 3.0 DATA ACQUISITION

We acquired ERP data along seven transects denoted Lines ERP-1 through -7, as shown in blue on Plate 1. The transect lengths were 2190-, 2145-, 1230-, 1230-, 1230-, 1335 and 1320-ft, respectively. The transect locations were determined jointly by NORCAL and Geosyntec personnel.

Data were collected using arrays of up to 56 stainless steel electrode spikes inserted into the ground at 15-ft stationing, yielding a “spread” length of 825-ft. To achieve the longer lines, we employed a “roll along” technique. This involves moving the first cable to the end of the line in a leap-frog fashion after the initial measurements have been completed. Additional readings are obtained to extend the coverage in the direction of movement without a gap in data coverage.

The depth of exploration is based on the ER structure of the sub-surface and the length of the ERP spread. The maximum depth is estimated at 200-ft for all the ERP lines.

### 4.0 DATA PROCESSING

Once data acquisition was complete, we downloaded the ER data from the SuperSting R8 to a computer using the program **AGISSADMIN** by AGI. The data were archived and then inverted using the **Earthmager 2D** software, also by AGI.

*The resistivity data inversion proceeded as follows:*

- 1) A starting resistivity model was constructed based on the apparent resistivity ( $\rho_a$ ) distribution.
- 2) A virtual survey (forward modeling) was carried out for a predicted data set over the starting model and the initial root mean squared (RMS) error at the zero-th iteration was calculated.
- 3) A linearized inverse problem was solved based on the current model and data misfit for a model update ( $\Delta\mathbf{m}$ ).
- 4) The resistivity model was updated using the formula:  $\mathbf{m}_{i+1} = \mathbf{m}_i + \Delta\mathbf{m}$ , where  $\mathbf{m}$  consists of electrical conductivity of all model blocks in the finite element mesh and  $i$  is the iteration number.
- 5) A forward model (virtual survey) was run based on the updated model for an updated predicted data set.
- 6) A new RMS was calculated for the error between the predicted data and the measured data.
- 7) Steps (3) to (6) were repeated until the programmed stop criteria were satisfied, at which point the inversion was stopped.

Following each run of the inversion routine we reviewed the inversion diagrams produced by the software (not shown) to determine the degree of fit. If the RMS was considered to be too high, we would use routines included in EarthImager to filter the data by removing noisy data points. Typically, we removed no more than 10% at a time. We would then rerun the inversion process. This procedure was continued until an inverted model with acceptably low RMS was produced.

## **5.0 ELECTRICAL RESISTIVITY PROFILES**

We used **Surfer 16.0**, software by Golden Software, to grid and contour the  $(x,y,z)$  data output by EarthImager 2D. This resulted in two color-contoured electrical resistivity pseudo cross-sections (profiles) depicting the variation in electrical resistivity values versus depth and distance beneath the two ER lines. For each profile, the vertical axis represents elevation in feet (NAVD88) and the horizontal axis represents distance (Station) in feet from the beginning of the line (south/west end). A color bar shown at the bottom of the plate indicates the relation between color and electrical resistivity. The electrical resistivity values are contoured on a logarithmic scale.

## 6.0 LIMITATIONS

A common feature of all electrical methods is that the models derived from the electric imaging are not unique. That is, depending on the subsurface geo-electric structure, there may be many models that will produce essentially the same apparent resistivities. This is known as the *principal of equivalence*. To overcome this limitation, computer software programs include routines for evaluating the equivalence of a given model relative to the observed resistivity values, resulting in a model that provides the closest fit to the observed data. Additionally, if the ground surface is too resistive, the system may have problems transmitting current into the subsurface (this situation can be remedied through the application of salt water at the base of each electrode). Conversely, if the ground surface is highly conductive, the potentials measured become negligible, resulting in a very low signal-to-noise ratio and therefore unreliable data.

Dear David:

The following report presents the results of Gregg Drilling’s Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	<input checked="" type="checkbox"/>
2	Pore Pressure Dissipation Tests	(PPD)	<input checked="" type="checkbox"/>
3	Seismic Cone Penetration Tests	(SCPTU)	<input type="checkbox"/>
4	Groundwater Samples	(GWS)	<input checked="" type="checkbox"/>
5	Soil Samples	(SS)	<input type="checkbox"/>
6	Vapor Samples	(VS)	<input type="checkbox"/>

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact me at 562-427-6899.

Sincerely,

CPT Reports Team  
Gregg Drilling, LLC.

## Cone Penetration Testing (CPT) Procedure

Gregg Drilling carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, Figure CPT.

The cone takes measurements of tip resistance ( $q_c$ ), sleeve resistance ( $f_s$ ), and penetration pore water pressure ( $u_2$ ). Measurements are taken at either 2.5 or 5cm intervals during penetration to provide a nearly continuous profile. CPT data reduction and basic interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored electronically for further analysis and reference. All CPT soundings are performed in accordance with revised ASTM standards (D 5778-12).

The 5mm thick porous plastic filter element is located directly behind the cone tip in the  $u_2$  location. A new saturated filter element is used on each sounding to measure both penetration pore pressures as well as measurements during a dissipation test (PPDT). Prior to each test, the filter element is fully saturated with oil under vacuum pressure to improve accuracy.

When the sounding is completed, the test hole is backfilled according to client specifications. If grouting is used, the procedure generally consists of pushing a hollow tremie pipe with a "knock out" plug to the termination depth of the CPT hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

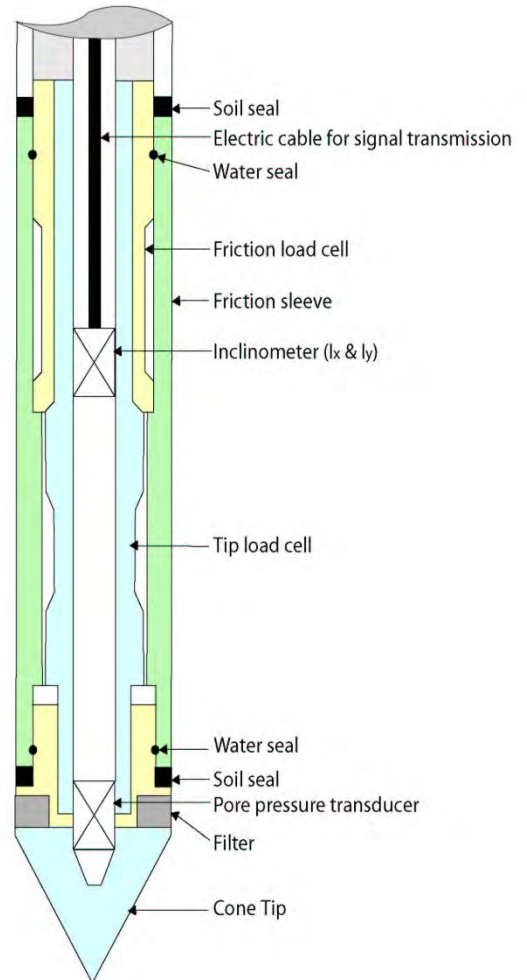

Figure CPT

## 15cm<sup>2</sup> Standard Cone Specifications

<b>Overload capacity</b>	150%
<b>Repeatability</b>	7 kPa (1 psi)

*Note: The repeatability during field use will depend somewhat on ground conditions, abrasion, maintenance and zero load stability.*

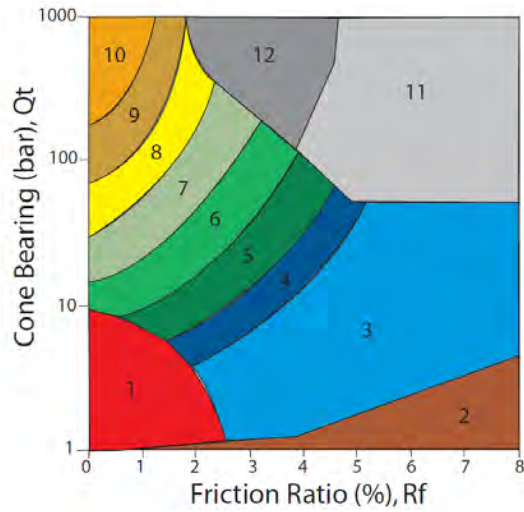

## Cone Penetration Test Data & Interpretation

The Cone Penetration Test (CPT) data collected are presented in graphical and electronic form in the report. The plots include interpreted Soil Behavior Type (SBT) based on the charts described by Robertson (1990). Typical plots display SBT based on the non-normalized charts of Robertson et al (1990) or normalized data (2010 and 2016). For CPT soundings deeper than 30m, we recommend the use of the normalized charts of Robertson (2010 and 2016) which can be displayed as SBTn (Figure SBTn). The report also includes spreadsheet output of computer calculations of basic interpretation in terms of SBT and SBTn and various geotechnical parameters using current published correlations based on the comprehensive review by Lunne, Robertson and Powell (1997), as well as recent updates by Professor Robertson (Guide to Cone Penetration Testing, 2015). The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg Drilling LLC does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software. Some interpretation methods require input of the groundwater level to calculate vertical effective stress. An estimate of the in-situ groundwater level has been made based on field observations and/or CPT results but should be verified by the user.

A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Note that it is not always possible to clearly identify a soil type based solely on  $q_t$ ,  $f_s$ , and  $u_2$ . In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the correct soil behavior type.

## Pore Pressure Dissipation Tests (PPDTs)

Pore Pressure Dissipation Tests (PPDT's) conducted at various intervals can be used to measure equilibrium water pressure (at the time of the CPT). If conditions are hydrostatic, the equilibrium water pressure can be used to determine the approximate depth of the ground water table. A PPDT is conducted when penetration is halted at specific intervals determined by the field representative. The variation of the penetration pore pressure ( $u$ ) with time is measured behind the tip of the cone and recorded.

Pore pressure dissipation data can be interpreted to provide estimates of:

- Equilibrium piezometric pressure
- Phreatic Surface
- In situ horizontal coefficient of consolidation ( $c_h$ )
- In situ horizontal coefficient of permeability ( $k_h$ )

To correctly interpret the equilibrium piezometric pressure and/or the phreatic surface, the pore pressure must be monitored until it reaches equilibrium, *Figure PPDT*. This time is commonly referred to as  $t_{100}$ , the point at which 100% of the excess pore pressure has dissipated.

A complete reference on pore pressure dissipation tests is presented by Robertson et al. 1992 and Lunne et al. 1997.

A summary of the pore pressure dissipation tests completed for this project is included in Table 1.

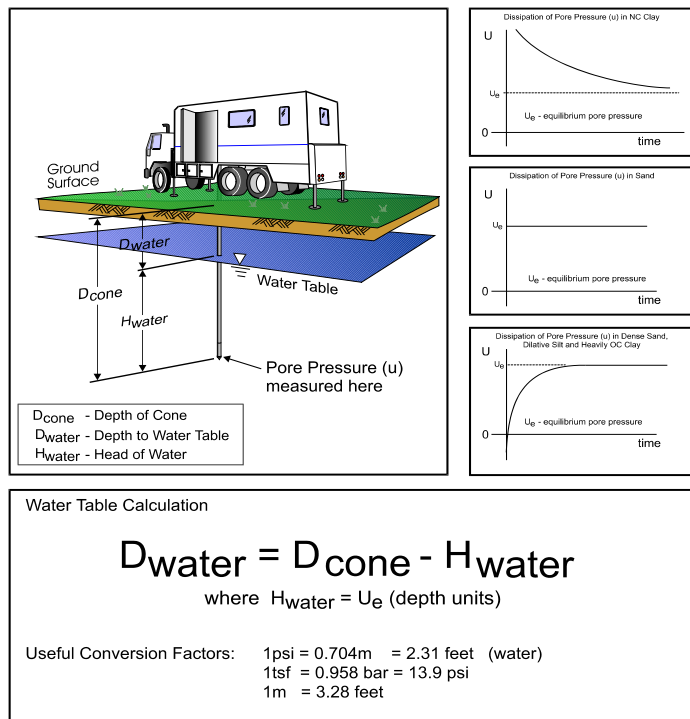

Figure PPDT

## Seismic Cone Penetration Tests (SCPT)

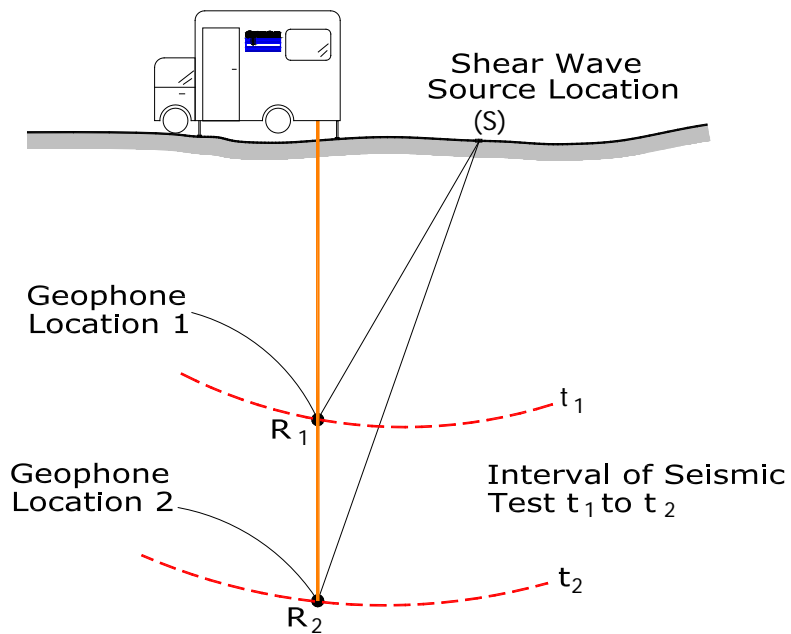

Seismic Cone Penetration Testing (SCPT) can be conducted at various intervals during the Cone Penetration Test. Shear wave velocity ( $V_s$ ) can then be calculated over a specified interval with depth. A small interval for seismic testing, such as 1-1.5m (3-5ft) allows for a detailed look at the shear wave profile with depth. Conversely, a larger interval such as 3-6m (10-20ft) allows for a more average shear wave velocity to be calculated. Gregg Drilling's cones have a horizontally active geophone located 0.2m (0.66ft) behind the tip.

To conduct the seismic shear wave test, the penetration of the cone is stopped and the rods are decoupled from the rig. An automatic hammer is triggered to send a shear wave into the soil. The distance from the source to the cone is calculated knowing the total depth of the cone and the horizontal offset distance between the source and the cone. To calculate an interval velocity, a minimum of two tests must be performed at two different depths. The arrival times between the two wave traces are compared to obtain the difference in time ( $\Delta t$ ). The difference in depth is calculated ( $\Delta d$ ) and velocity can be determined using the simple equation:  $v = \Delta d / \Delta t$

Multiple wave traces can be recorded at the same depth to improve quality of the data.

A complete reference on seismic cone penetration tests is presented by Robertson et al. 1986 and Lunne et al. 1997.

A summary of the shear wave velocities, arrival times and wave traces are provided with the report.

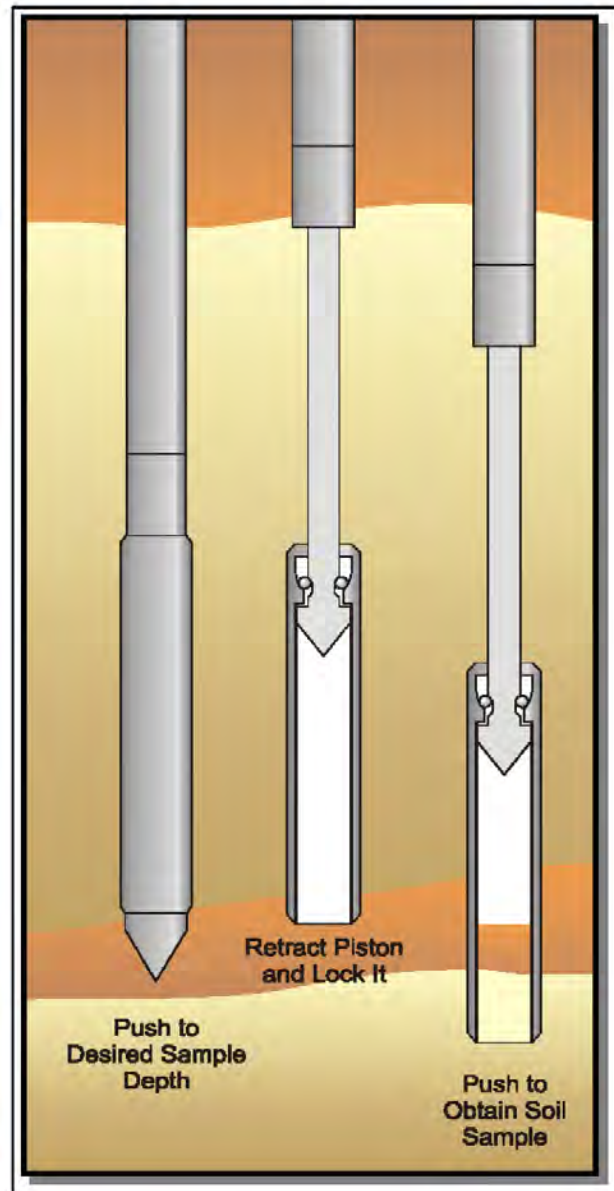

$$\text{Velocity } V = \frac{SR_2 - SR_1}{t_2 - t_1}$$

Figure SCPT

## Soil Sampling

Gregg Drilling uses a piston-type push-in sampler to obtain small soil samples without generating any soil cuttings, *Figure SS*. Two different types of samplers (12 and 18 inch) are used depending on the soil type and density. The soil sampler is initially pushed in a "closed" position to the desired sampling interval using the CPT pushing equipment. Keeping the sampler closed minimizes the potential of cross contamination. The inner tip of the sampler is then retracted leaving a hollow soil sampler with inner 1¼" diameter sample tubes. The hollow sampler is then pushed in a locked "open" position to collect a soil sample. The filled sampler and push rods are then retrieved to the ground surface. Because the soil enters the sampler at a constant rate, the opportunity for 100% recovery is increased. For environmental analysis, the soil sample tube ends are sealed with Teflon and plastic caps. Often, a longer "split tube" can be used for geotechnical sampling.

*For a detailed reference on direct push soil sampling, refer to Robertson et al, 1998.*

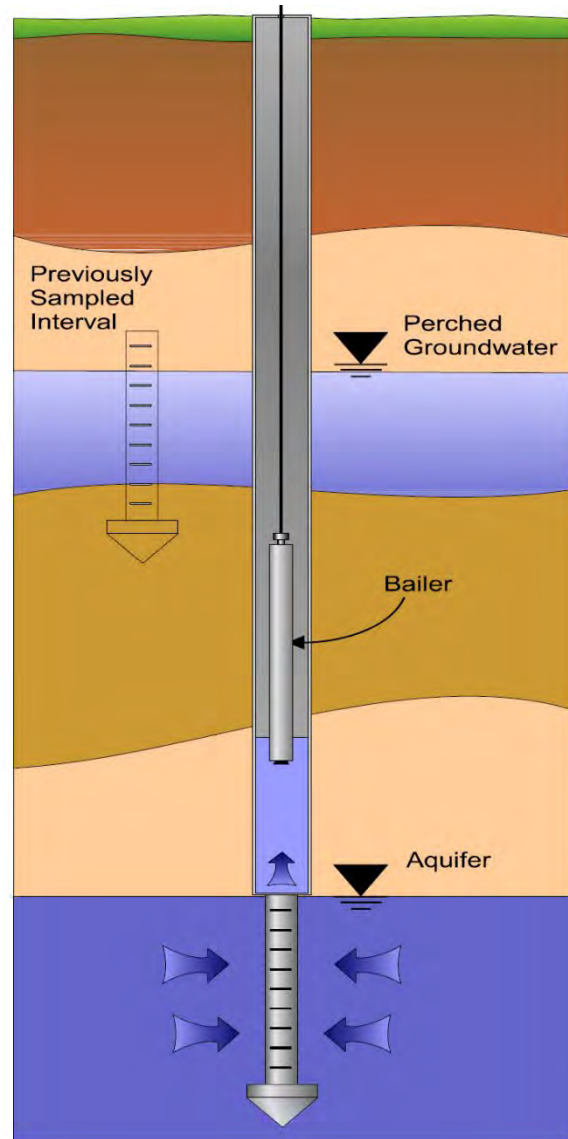

*Figure SS*

## Ground Water Sampling

Gregg Drilling conducts groundwater sampling using a sampler as shown in *Figure GWS*. The groundwater sampler has a retrievable stainless steel or disposable PVC screen with steel drop off tip. This allows for samples to be taken at multiple depth intervals within the same sounding location. In areas of slower water recharge, provisions may be made to set temporary PVC well screens during sampling to allow the pushing equipment to advance to the next sample location while the groundwater is allowed to infiltrate.

The groundwater sampler operates by advancing 44.5mm (1¾ inch) hollow push rods with the filter tip in a closed configuration to the base of the desired sampling interval. Once at the desired sample depth, the push rods are retracted; exposing the encased filter screen and allowing groundwater to infiltrate hydrostatically from the formation into the inlet screen. A small diameter bailer (approximately ½ or ¾ inch) is lowered through the push rods into the screen section for sample collection. The number of downhole trips with the bailer and time necessary to complete the sample collection at each depth interval is a function of sampling protocols, volume requirements, and the yield characteristics and storage capacity of the formation. Upon completion of sample collection, the push rods and sampler, with the exception of the PVC screen and steel drop off tip are retrieved to the ground surface, decontaminated and prepared for the next sampling event.

*Figure GWS*

*For a detailed reference on direct push groundwater sampling, refer to Zemo et. al., 1992.*

Stockton, CA 95205

**Subject: Four Exploratory Boreholes**  
Delta Water Treatment Plant, Lodi, CA

To whom it may concern:

On behalf of the Delta Water Treatment Plant, Geosyntec Consultants, Inc. (Geosyntec) is planning to advance four exploratory boreholes; each to a total depth of 90 feet. Sonic Drilling Technology is the method of excavation. The total depth of the boreholes may be modified based on findings in the field. During drilling of each borehole, the lithology will be recorded continuously, and depth discrete disturbed grab samples will be collected at 5-foot intervals or change in lithology. A photographic log of this material will also be prepared and presented with the final geologic boring log. At two selected depths within the vadose zone of each soil boring (upper 40 to 60 feet), down-hole permeability tests will be conducted within major material types identified during drilling. The permeability tests will be conducted by advancing the outer casing of the sonic drill stem to the desired depth. A pressure transducer will then be lowered down the drill stem and programmed to record water levels at 10 to 15 second intervals. The drill stem will then be filled with water then allowed to infiltrate into the desired materials. Three soil samples will also be collected from each soil boring, two within the vadose zone and one within the upper groundwater aquifer at selected intervals.

Included in this permit application package are the following:

- Attachment 1 – Four exploratory borehole permit and map

This work is scheduled to start on November 17<sup>th</sup>, 2022 and is anticipated to take three days to complete.

Ms. Deanna Jackson

I, the Owner/Applicant/Licensed Well Driller/Pump Contractor agrees to indemnify, defend with counsel reasonably approved by County, and hold harmless the County and its officers, officials, employees, agents, boards, and commissions (collectively "County") as follows:

1. Indemnity:
  - a. From and against any and all claims, demands, actions, proceedings, lawsuits, losses, damages, judgments and/or liabilities arising out of, related to, or in connection with the application and applied for well or pump or to attack, set aside, void, or annul, in whole or in part, approval or denial of the applied for permit by the County, and any environmental review documents related to the applied for permit;
  - b. For any and all costs and expenses incurred by the County on account of any Claim, except where such indemnification is prohibited by law, including but not limited to damages, costs, expenses, attorney's fees, or expert witness costs that may be asserted by any person or entity, private attorney general fees claimed by or awarded to any party against the County, and the County's costs incurred in preparing an administrative record which are not paid by the petitioner.
  - c. Except as to the County's sole negligence or willful misconduct.
2. Defense:
  - a. The County may participate or direct the defense of any Claim. The County's actions in defense of any claim shall not relieve me of any obligation to indemnify, defend, and hold harmless the County.
  - b. In the event of a disagreement between County and me regarding defense of any Claim, the County shall have the authority to control the litigation and make litigation decisions, including, but not limited to, the manner in which the defense is conducted.

If County reasonably determines that having common counsel presents such counsel with a conflict of interest, or if I fail to promptly assume the defense of any Claim or to promptly employ counsel reasonably satisfactory to the County, then County may utilize the Office of the County Counsel or employ separate outside counsel to represent or defend the County, and I shall pay the reasonable attorneys' fees and costs of such counsel.

**I HEREBY CERTIFY THAT I HAVE PREPARED THIS APPLICATION AND THAT THE WORK WILL BE DONE IN ACCORDANCE WITH SAN JOAQUIN COUNTY ORDINANCES, STATE LAWS, AND RULES AND REGULATIONS. I ALSO CERTIFY THAT MY REQUIRED LICENSE IS CURRENT AND ACTIVE WITH THE CALIFORNIA CONTRACTORS STATE LICENSE BOARD AND THAT I AM IN COMPLIANCE WITH ALL WORKERS COMPENSATION LAWS.**

**Subject: Installation of Two Monitoring Wells Permit**  
Delta Water Treatment Plan, Lodi, CA

To whom it may concern:

On behalf of the Delta Water Treatment Plant, Geosyntec Consultants, Inc. (Geosyntec) is planning to two monitoring wells; each to a total depth of 90 feet below ground surface (bgs). One monitoring well will be nested with completions at 70 feet, 80 feet and 90 feet. During drilling the lithology will be recorded continuously on a geologic boring log. A photographic log of the material will also be prepared. Using the information collected during drilling, a California Certified Hydrogeologist will develop the final well design to include screen intervals, well screen slot size, and gravel pack type, size and gradation. It is anticipated that the nested well will include three separate screen intervals 5 to 10-feet in length; one at the top of the first encountered groundwater estimated to be 40 to 60 bgs, mid-way between first encountered groundwater and total depth of the soil boring, and at the bottom of the soil boring. The single completion monitoring well is anticipated to be screened from first encountered groundwater to the total depth of the soil boring. Well installation methods will be consistent with San Joaquin County guidelines. Well casing in the nested well will consist of 2.5-inch diameter schedule 80 PVC. The single completion well will consist of 6-inch diameter schedule 80 PVC.

Included in this application package are the following:

- Attachment 1 – Permit for two monitoring wells with map

This work is scheduled to start on November 17<sup>th</sup>, 2022 and is anticipated to take five days to complete. The wells will be installed per the Department of Water Resources Well Bulletin 74-81 and 794-90.

DOMESTIC WELL SAMPLING:  General Mineral/Coliform Bacteria (4391)  Dibromochloropropane (4392)  Arsenic (4393)

INTENDED USE  Domestic/Private  Irrigation/Agricultural  Industrial  Water Quality Monitoring  Soil Sampling/Characterization

Public Water System \_\_\_\_\_

If different from Owner: Water System Name \_\_\_\_\_ Contact Name or Phone Number \_\_\_\_\_

TYPE OF WORK  New Well  Replacement Well  Well Alteration/Modification  Other \_\_\_\_\_

Monitoring Well(s) 2 # of wells  Soil Boring(s) NA # of borings  Geotechnical NA # of borings

Out-Of-Service Well  Out-Of-Service Well Renewal  Cross-Connection Repair

New Pump  Pump Replacement  Pump Repair  Raise Well Casing

WELL CONSTRUCTION

Drilling Method  Mud Rotary  Air Rotary  Auger  Cable Tool  Push Point  Other Sonic Drilling

Proposed Well Depth 90 ft Excavation 10 in diameter  Open Bottom  Gravel Pack/Gravel Size \_\_\_\_\_ in diameter

Conductor Casing 6 in diameter / Conductor Casing Depth 15 ft

Well Casing Diameter 6 in Thickness/Gauge/ASTM Sched 80  Steel  Plastic  Stainless Steel  Other Sch 80 PVC

Grout Seal Depth 20 ft  Neat Cement (94 lb bag/5-10 gal water)  Sand Cement \_\_\_\_\_ sack mix/7 gal water

Bentonite (20% solids)  Other \_\_\_\_\_

Grout Placement Method  Pumped  Free Fall  Other \_\_\_\_\_  Retardant / Accelerator (name) \_\_\_\_\_

PEDESTAL Installed By  Driller  Pump Contractor  Other \_\_\_\_\_

Concrete Pedestal  Dimensions: Width \_\_\_\_\_ ft Length \_\_\_\_\_ ft Thick \_\_\_\_\_

Christy Box  Stove Pipe

PUMP  Submersible  Turbine  Other NA HP NA Pump Set NA ft Standing Water Level NA ft

Plot Plan Requirements: Attach a plot plan with the exact location of water well with respect to the following items: GPS Coordinates, property lines, adjoining properties, water bodies or courses, drainage pattern, roads, existing wells, structures, potential sources of contamination, sewers or private disposal systems. Include distance from two property lines. For Domestic, Agriculture, Industrial well, provide location of any water wells or surface water within 200' radius of proposed well.

MINIMUM 24 HOUR ADVANCE NOTICE REQUIRED FOR INSPECTIONS - PLEASE CALL (209) 953-7697

I, the Owner/Applicant/Licensed Well Driller/Pump Contractor agrees to indemnify, defend with counsel reasonably approved by County, and hold harmless the County and its officers, officials, employees, agents, boards, and commissions (collectively "County") as follows:

1. Indemnity:
  - a. From and against any and all claims, demands, actions, proceedings, lawsuits, losses, damages, judgments and/or liabilities arising out of, related to, or in connection with the application and applied for well or pump or to attack, set aside, void, or annul, in whole or in part, approval or denial of the applied for permit by the County, and any environmental review documents related to the applied for permit;
  - b. For any and all costs and expenses incurred by the County on account of any Claim, except where such indemnification is prohibited by law, including but not limited to damages, costs, expenses, attorney's fees, or expert witness costs that may be asserted by any person or entity, private attorney general fees claimed by or awarded to any party against the County, and the County's costs incurred in preparing an administrative record which are not paid by the petitioner.
  - c. Except as to the County's sole negligence or willful misconduct.
2. Defense:
  - a. The County may participate or direct the defense of any Claim. The County's actions in defense of any claim shall not relieve me of any obligation to indemnify, defend, and hold harmless the County.
  - b. In the event of a disagreement between County and me regarding defense of any Claim, the County shall have the authority to control the litigation and make litigation decisions, including, but not limited to, the manner in which the defense is conducted.

If County reasonably determines that having common counsel presents such counsel with a conflict of interest, or if I fail to promptly assume the defense of any Claim or to promptly employ counsel reasonably satisfactory to the County, then County may utilize the Office of the County Counsel or employ separate outside counsel to represent or defend the County, and I shall pay the reasonable attorneys' fees and costs of such counsel.

**I HEREBY CERTIFY THAT I HAVE PREPARED THIS APPLICATION AND THAT THE WORK WILL BE DONE IN ACCORDANCE WITH SAN JOAQUIN COUNTY ORDINANCES, STATE LAWS, AND RULES AND REGULATIONS. I ALSO CERTIFY THAT MY REQUIRED LICENSE IS CURRENT AND ACTIVE WITH THE CALIFORNIA CONTRACTORS STATE LICENSE BOARD AND THAT I AM IN COMPLIANCE WITH ALL WORKERS COMPENSATION LAWS.**

# HYDRAULIC CONDUCTIVITY TEST REPORT

## SAMPLE DATA

Sample Identification: 20221511-B-2-5 A

Sample Depth, ft.: N/A

Lab No.: 84554

Visual Description: Yellow Sandy Lean Clay (CL)

Sample Type: Mod Cal

Sample Date: 11/15/22

Age, days: 7

Remarks:

## TEST RESULTS

Permeability, cm/sec.: 5.49E-07

Average Hydraulic Gradient: 9.26

Chamber Pressure, psi: 80.0

Initial Hydraulic Gradient: 9.44

Back Pressure, psi: 70.0

Final Hydraulic Gradient: 9.07

Consolidation Pressure: 10.0

Burrett Area (cm<sup>2</sup>): 0.85

"B" Coefficient: 96.0%

Permeant Liquid Used: Tap Water

## TEST SAMPLE DATA

### Before Test

Specimen Height, cm: 7.57

Specimen Diameter, cm: 6.10

Dry Unit Weight, pcf: 110.0

Moisture Content, %: 17.6

Specific Gravity (assumed): 2.70

Initial Saturation, %: 81.1

### After Test

Specimen Height, cm: 7.71

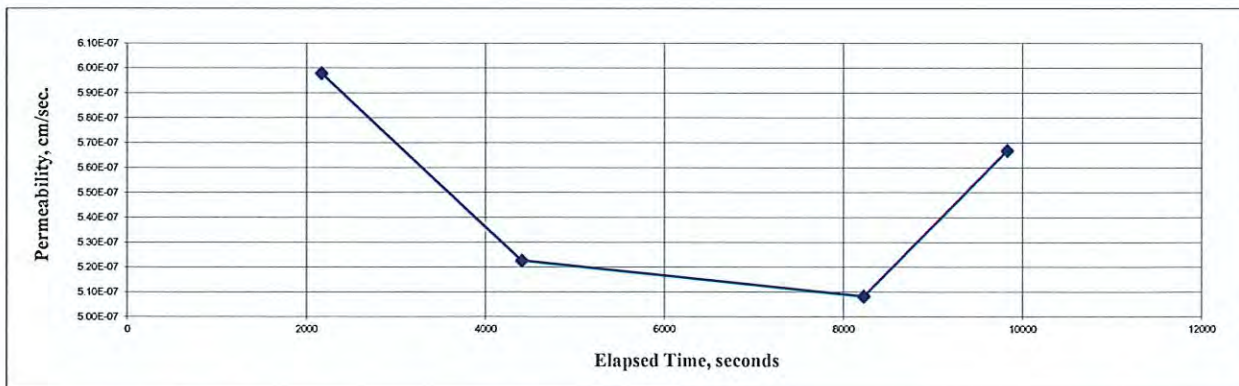

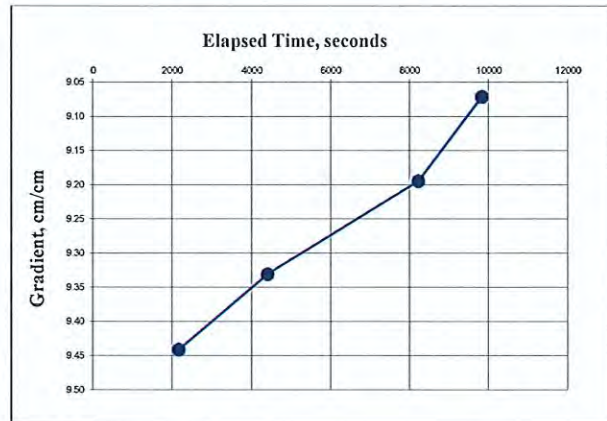

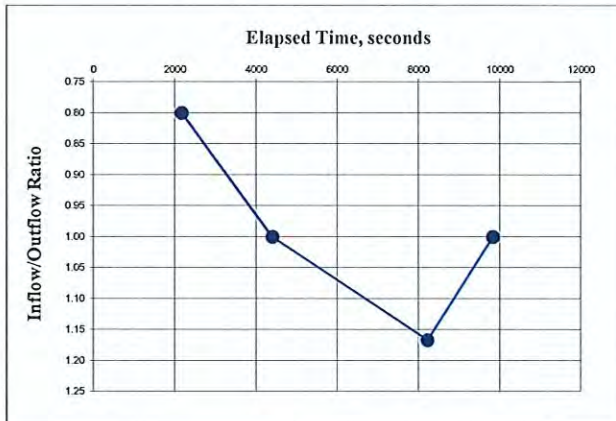

Specimen Diameter, cm: 6.07

Dry Unit Weight, pcf: 111.4

Moisture Content, %: 18.9

Specific Gravity (assumed): 2.70

Final Saturation, %: 99.6

Test Method: ASTM D5084 Method C

PROJECT NUMBER: 22-243      November 22, 2022

Permeability, cm/sec.: 1.39E-07

Average Hydraulic Gradient: 9.38

Chamber Pressure, psi: 70.0

Initial Hydraulic Gradient: 9.49

Back Pressure, psi: 60.0

Final Hydraulic Gradient: 9.28

Consolidation Pressure: 10.0

Burrett Area (cm<sup>2</sup>): 0.85

"B" Coefficient: 99.0%

Permeant Liquid Used: Tap Water

## TEST SAMPLE DATA

### Before Test

Specimen Height, cm: 9.17

Specimen Diameter, cm: 6.10

Dry Unit Weight, pcf: 93.9

Moisture Content, %: 27.3

Specific Gravity (assumed): 2.70

Initial Saturation, %: 97.4

### After Test

Specimen Height, cm: 9.15

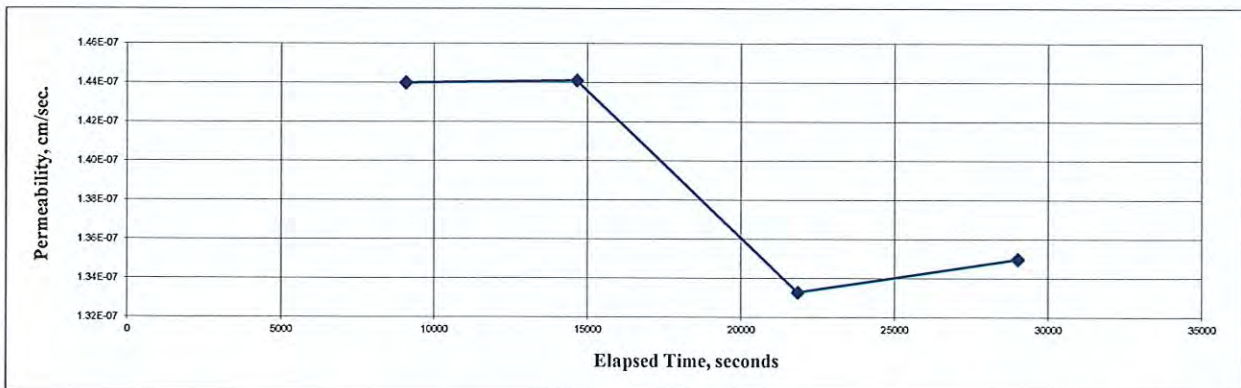

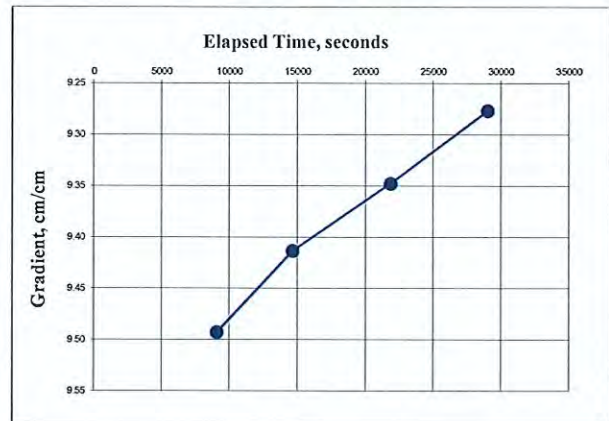

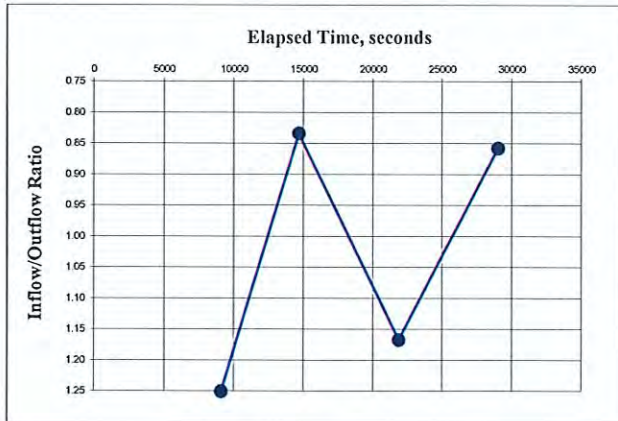

Specimen Diameter, cm: 6.11

Dry Unit Weight, pcf: 91.8

Moisture Content, %: 30.9

Specific Gravity (assumed): 2.70

Final Saturation, %: 99.9

Test Method: ASTM D5084 Method C

# HYDRAULIC CONDUCTIVITY TEST REPORT

## SAMPLE DATA

Sample Identification: 20221711-B-4-60 A

Sample Depth, ft.: N/A

Lab No.: 84607

Visual Description: Olive brown Clayey Sand (SC)

Sample Type: Mod Cal

Date Cast: 11/17/22

Age, days: 5

Remarks:

## TEST RESULTS

Permeability, cm/sec.: 1.37E-07

Average Hydraulic Gradient: 9.06

Chamber Pressure, psi: 110.0

Initial Hydraulic Gradient: 9.60

Back Pressure, psi: 100.0

Final Hydraulic Gradient: 8.19

Consolidation Pressure: 10.0

Burrett Area (cm<sup>2</sup>): 0.30

"B" Coefficient: 71.0%

Permeant Liquid Used: Tap Water

## TEST SAMPLE DATA

### Before Test

Specimen Height, cm: 8.10

Specimen Diameter, cm: 6.10

Dry Unit Weight, pcf: 124.9

Moisture Content, %: 11.0

Specific Gravity (assumed): 2.70

Initial Saturation, %: 94.6

### After Test

Specimen Height, cm: 8.10

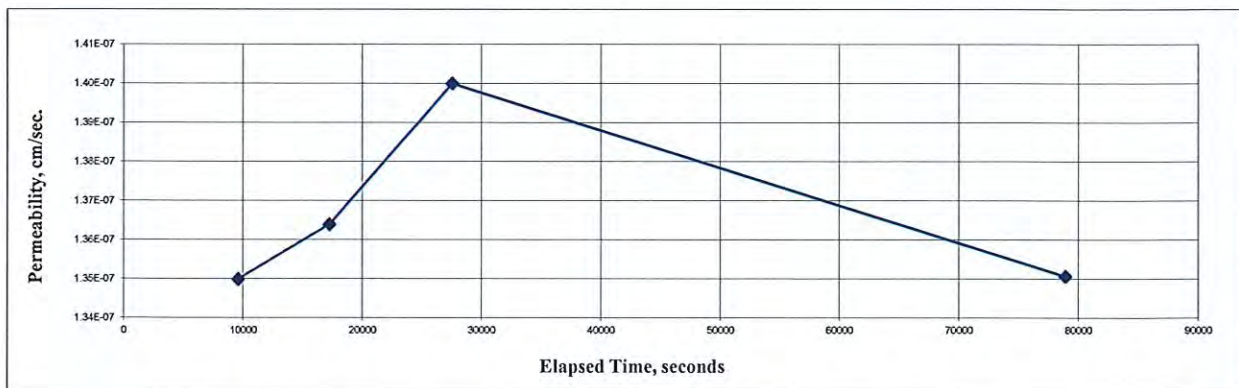

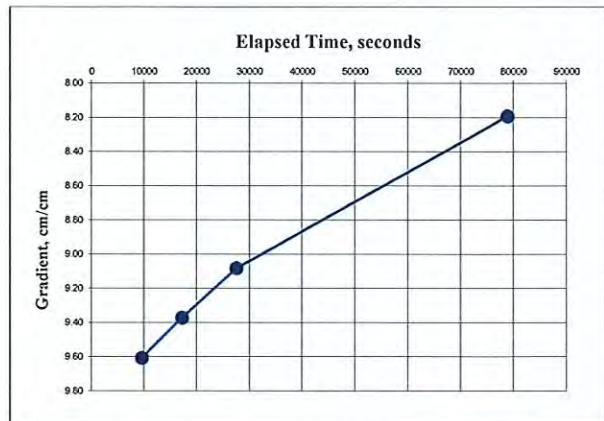

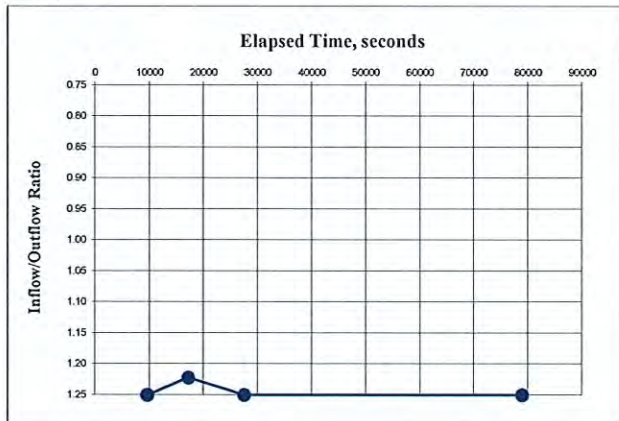

Specimen Diameter, cm: 6.12

Dry Unit Weight, pcf: 121.6

Moisture Content, %: 14.3

Specific Gravity (assumed): 2.70

Final Saturation, %: 99.7

Test Method: ASTM D5084 Method C

---

This data package contains sample and QC results for six soil samples, requested for the above referenced project on 11/15/22. The samples were received cold and intact.

### **Metals (EPA 6010B and EPA 7471A):**

- Low recoveries were observed for antimony in the MS/MSD of 20221411-B-1-5 (lab # 473170-001); the LCS was within limits, and the associated RPD was within limits.
- Iron was detected above the RL in the method blank for batch 301430; this analyte was detected in samples at a level at least 10 times that of the blank.
- Iron was detected above the RL in the method blank for batch 302326; this analyte was detected in the sample at a level at least 10 times that of the blank.
- No other analytical problems were encountered.

### **Ion Chromatography (EPA 300.0):**

No analytical problems were encountered.

### **Total Phosphate as P (SM 4500-P-B2-E):**

No analytical problems were encountered.

### **Alkalinity (SM2320B):**

No analytical problems were encountered.

### **Total Organic Carbon (TOC) (WALKLEY-BLACK):**

No analytical problems were encountered.

### **Nitrate and Nitrite (EPA 353.2):**

No analytical problems were encountered.

### **EPA 9034 Sulfide (EPA 9034):**

McCampbell Analytical, Inc. in Pittsburg, CA performed the analysis (see sublab report section for certifications). Please see the McCampbell Analytical, Inc. case narrative.

# ENTHALPY ANALYTICAL

## SAMPLE ACCEPTANCE CHECKLIST

**Section 1**  
 Client: Geosytec Consultants Project: SF0140  
 Date Received: 11/16/22 Sampler's Name Present:  Yes  No

**Section 2**  
 Sample(s) received in a cooler?  Yes, How many? 1  NO (skip section 2) Sample Temp (°C) (No Cooler) : \_\_\_\_\_  
 Sample Temp (°C), One from each cooler: #1: 1.9 #2: \_\_\_\_\_ #3: \_\_\_\_\_ #4: \_\_\_\_\_  
*(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)*  
 Shipping Information: \_\_\_\_\_

**Section 3**  
 Was the cooler packed with:  Ice  Ice Packs  Bubble Wrap  Styrofoam  
 Paper  None  Other \_\_\_\_\_  
 Cooler Temp (°C): #1: 0.4 #2: \_\_\_\_\_ #3: \_\_\_\_\_ #4: \_\_\_\_\_

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)	✓		✓ <i>2/11/16/22</i>
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

**Section 5 Explanations/Comments**  
 \_\_\_\_\_

**Section 6**  
 For discrepancies, how was the Project Manager notified?  Verbal PM Initials: \_\_\_\_\_ Date/Time \_\_\_\_\_  
 Email (email sent to/on): \_\_\_\_\_ / \_\_\_\_\_  
 Project Manager's response:  
 \_\_\_\_\_

## Analytical Report

**WorkOrder:** 2211E98

**Report Created for:** Enthalpy Analytical

931 West Barkley Avenue  
Orange, CA 92868

**Project Contact:** Miguel Gamboa

**Project P.O.:** 037286

**Project:** EO-473170

**Project Received:** 11/22/2022

Analytical Report reviewed & approved for release on 12/01/2022 by:

Susan Thompson  
Project Manager

*The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in a case narrative.*

## Glossary of Terms & Qualifier Definitions

**Client:** Enthalpy Analytical

**WorkOrder:** 2211E98

**Project:** EO-473170

### Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016.
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
NA	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting limit is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

**NOTES:** \* STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U\*\* = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.

---

This data package contains sample and QC results for six soil samples, requested for the above referenced project on 11/18/22. The samples were received cold and intact.

### **Metals (EPA 6010B and EPA 7471A):**

- Low recoveries were observed for antimony in the MS/MSD of 20221711-B-4-5 B (lab # 473414-001); the LCS was within limits, and the associated RPD was within limits. High recoveries were observed for manganese; the LCS was within limits, and the associated RPD was within limits.
- Iron was detected above the RL in the method blank for batch 301583; this analyte was detected in samples at a level at least 10 times that of the blank.
- No other analytical problems were encountered.

### **Ion Chromatography (EPA 300.0):**

- High recovery was observed for chloride in the LCS for batch 301878; this analyte was not detected at or above the RL in the associated samples.
- Responses exceeding the instrument's linear range were observed for chloride in the LCS for batch 301878 and the MS/MSD of 20221711-B-4-5 B (lab # 473414-001); affected data was qualified with "E".
- No other analytical problems were encountered.

### **Total Phosphate as P (SM 4500-P-B2-E):**

No analytical problems were encountered.

### **Alkalinity (SM2320B):**

No analytical problems were encountered.

### **Total Organic Carbon (TOC) (WALKLEY-BLACK):**

No analytical problems were encountered.

### **Nitrate and Nitrite (EPA 353.2):**

No analytical problems were encountered.

### **EPA 9034 Sulfide (EPA 9034):**

McC Campbell Analytical, Inc. in Pittsburg, CA performed the analysis (see sublab report section for certifications). Please see the McC Campbell Analytical, Inc. case narrative.

# ENTHALPY ANALYTICAL

## SAMPLE ACCEPTANCE CHECKLIST

**Section 1**  
 Client: Geosyntec Project: SFO140  
 Date Received: 11/18/22 Sampler's Name Present:  Yes  No

**Section 2**  
 Sample(s) received in a cooler?  Yes, How many? 1  NO (skip section 2) Sample Temp (°C) (No Cooler) : \_\_\_\_\_  
 Sample Temp (°C), One from each cooler: #1: 2.5 #2: \_\_\_\_\_ #3: \_\_\_\_\_ #4: \_\_\_\_\_  
*(Acceptance range is < 6°C but not frozen for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)*  
 Shipping Information: \_\_\_\_\_

**Section 3**  
 Was the cooler packed with:  Ice  Ice Packs  Bubble Wrap  Styrofoam  
 Paper  None  Other \_\_\_\_\_  
 Cooler Temp (°C): #1: 0.3 #2: \_\_\_\_\_ #3: \_\_\_\_\_ #4: \_\_\_\_\_

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

**Section 5 Explanations/Comments**  
 \_\_\_\_\_  
 \_\_\_\_\_

**Section 6**  
 For discrepancies, how was the Project Manager notified?  Verbal PM Initials: \_\_\_\_\_ Date/Time \_\_\_\_\_  
 Email (email sent to/on): \_\_\_\_\_ / \_\_\_\_\_  
 Project Manager's response:  
 \_\_\_\_\_

## Analytical Report

**WorkOrder:** 2211E99

**Report Created for:** Enthalpy Analytical

931 West Barkley Avenue  
Orange, CA 92868

**Project Contact:** Miguel Gamboa

**Project P.O.:** 037285

**Project:** EO-473414

**Project Received:** 11/22/2022

Analytical Report reviewed & approved for release on 12/01/2022 by:

Susan Thompson  
Project Manager

*The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in a case narrative.*

## Glossary of Terms & Qualifier Definitions

**Client:** Enthalpy Analytical

**WorkOrder:** 2211E99

**Project:** EO-473414

### Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016.
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
NA	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting limit is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

**NOTES:** \* STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U\*\* = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.

Subcontract Laboratory:

 McCampbell Analytical, Inc.  
 1534 Willow Pass Rd.

## Sample Receipt Checklist

Client Name: Enthalpy Analytical  
 Project: EO-473414

Date and Time Received: 11/22/2022 10:09  
 Date Logged: 11/22/2022  
 Received by: Yvette Gallegos  
 Logged by: Yvette Gallegos

WorkOrder No: 2211E99 Matrix: Soil  
 Carrier: Golden State Overnight

### Chain of Custody (COC) Information

Chain of custody present?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Chain of custody signed when relinquished and received?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Chain of custody agrees with sample labels?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sample IDs noted by Client on COC?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Date and Time of collection noted by Client on COC?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sampler's name noted on COC?	Yes <input type="checkbox"/>	No <input checked="" type="checkbox"/>	
COC agrees with Quote?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/>

### Sample Receipt Information

Custody seals intact on shipping container/cooler?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/>
Custody seals intact on sample bottles?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>
Shipping container/cooler in good condition?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Samples in proper containers/bottles?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sample containers intact?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sufficient sample volume for indicated test?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	

### Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/>
Samples Received on Ice?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	

(Ice Type: WET ICE )

Sample/Temp Blank temperature		Temp: 2.6°C	NA <input type="checkbox"/>
ZHS conditional analyses: VOA meets zero headspace requirement (VOCs, TPHg/BTEX, RSK)?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>
Sample labels checked for correct preservation?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
pH acceptable upon receipt (Metal: <2; Nitrate 353.2/4500NO3: <2; 522: <4; 218.7: >8)?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>

### UCMR Samples:

pH tested and acceptable upon receipt (200.7: ≤2; 533: 6 - 8; 537.1: 6 - 8)?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>
Free Chlorine tested and acceptable upon receipt (<0.1mg/L) [not applicable to 200.7]?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>

## Analytical Report

**WorkOrder:** 2211E99

**Report Created for:** Enthalpy Analytical

931 West Barkley Avenue  
Orange, CA 92868

**Project Contact:** Miguel Gamboa

**Project P.O.:** 037285

**Project:** EO-473414

**Project Received:** 11/22/2022

Analytical Report reviewed & approved for release on 12/01/2022 by:

Susan Thompson  
Project Manager

*The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in a case narrative.*

## Glossary of Terms & Qualifier Definitions

**Client:** Enthalpy Analytical

**WorkOrder:** 2211E99

**Project:** EO-473414

### Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016.
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
NA	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting limit is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

**NOTES:** \* STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U\*\* = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.

### Chain of Custody (COC) Information

Chain of custody present?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Chain of custody signed when relinquished and received?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Chain of custody agrees with sample labels?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sample IDs noted by Client on COC?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Date and Time of collection noted by Client on COC?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sampler's name noted on COC?	Yes <input type="checkbox"/>	No <input checked="" type="checkbox"/>	
COC agrees with Quote?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/>

### Sample Receipt Information

Custody seals intact on shipping container/cooler?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/>
Custody seals intact on sample bottles?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>
Shipping container/cooler in good condition?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Samples in proper containers/bottles?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sample containers intact?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sufficient sample volume for indicated test?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	

### Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/>
Samples Received on Ice?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	

(Ice Type: WET ICE )

Sample/Temp Blank temperature		Temp: 2.6°C	NA <input type="checkbox"/>
ZHS conditional analyses: VOA meets zero headspace requirement (VOCs, TPHg/BTEX, RSK)?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>
Sample labels checked for correct preservation?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
pH acceptable upon receipt (Metal: <2; Nitrate 353.2/4500NO3: <2; 522: <4; 218.7: >8)?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>

### UCMR Samples:

pH tested and acceptable upon receipt (200.7: ≤2; 533: 6 - 8; 537.1: 6 - 8)?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>
Free Chlorine tested and acceptable upon receipt (<0.1mg/L) [not applicable to 200.7]?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>

#### Notes and Definitions

- E The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
- P-02 Sample acidified to pH <2 and allowed to sit 24 hours before further processing.
- QM-01 The spike recovery for this QC sample is outside of established control limits possibly due to a sample matrix interference.
- QM-05 The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
- QM-4X The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to analyte concentration at 4 times or greater the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
- R-01 The Reporting Limit for this analyte has been raised to account for matrix interference.
- T-14 Residual chlorine, dissolved oxygen, sulfite, and pH must be analyzed in the field to meet the EPA specified 15 minute hold time.
- ND Analyte NOT DETECTED at or above the reporting limit
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference

\* ELAP does not offer accreditation in this matrix for the requested analyte/method combination.

**Notes and Definitions**

- E The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
- P-02 Sample acidified to pH <2 and allowed to sit 24 hours before further processing.
- QM-01 The spike recovery for this QC sample is outside of established control limits possibly due to a sample matrix interference.
- QM-05 The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
- QM-4X The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to analyte concentration at 4 times or greater the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
- R-01 The Reporting Limit for this analyte has been raised to account for matrix interference.
- T-14 Residual chlorine, dissolved oxygen, sulfite, and pH must be analyzed in the field to meet the EPA specified 15 minute hold time.
- ND Analyte NOT DETECTED at or above the reporting limit
- dry Sample results reported on a dry weight basis
- REC Recovery
- RPD Relative Percent Difference

\* ELAP does not offer accreditation in this matrix for the requested analyte/method combination.

RE: Source Chemical

Work Order: 23D1873

Enclosed are the results of analyses for samples received by the laboratory on 04/12/23 23:40. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Rachel J. Kaua

Project Manager

---	--	-----------------------------

**Notes and Definitions**

- E The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
- P-02 Sample acidified to pH <2 and allowed to sit 24 hours before further processing.
- QM-01 The spike recovery for this QC sample is outside of established control limits possibly due to a sample matrix interference.
- QM-05 The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
- QM-4X The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to analyte concentration at 4 times or greater the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
- R-01 The Reporting Limit for this analyte has been raised to account for matrix interference.
- T-14 Residual chlorine, dissolved oxygen, sulfite, and pH must be analyzed in the field to meet the EPA specified 15 minute hold time.
- ND Analyte NOT DETECTED at or above the reporting limit
- dry Sample results reported on a dry weight basis
- REC Recovery
- RPD Relative Percent Difference

\* ELAP does not offer accreditation in this matrix for the requested analyte/method combination.

Dear Robbie Phillips,

Enclosed are the results of analyses for samples received 4/19/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.3 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

## Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

**Notes and Definitions**

- OD-1 Odor described as "Aquarium"
- QM-05 The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
- ND Analyte NOT DETECTED at or above the reporting limit
- dry Sample results reported on a dry weight basis
- REC Recovery
- RPD Relative Percent Difference

\* ELAP does not offer accreditation in this matrix for the requested analyte/method combination.

## Analytical Report

**WorkOrder:** 2304F54

**Report Created for:** Alpha Analytical Laboratories

262 Rickenbacker Circle  
Livermore, CA 94551

**Project Contact:** Rachel J. Kaua

**Project P.O.:**

**Project:** 23D2586

**Project Received:** 04/21/2023

Analytical Report reviewed & approved for release on 05/08/2023 by:

Christine Askari  
Project Manager

*The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in a case narrative.*

## Glossary of Terms & Qualifier Definitions

**Client:** Alpha Analytical Laboratories

**WorkOrder:** 2304F54

**Project:** 23D2586

### Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit <sup>1</sup>
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
NA	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting limit <sup>2</sup>
RPD	Relative Percent Difference
RRT	Relative Retention Time
RSD	Relative Standard Deviation
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure

<sup>1</sup> MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016.

<sup>2</sup> RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.)

**NOTES:** \* STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U\*\* = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.

#### Chain of Custody (COC) Information

- Chain of custody present? Yes  No
- Chain of custody signed when relinquished and received? Yes  No
- Chain of custody agrees with sample labels? Yes  No
- Sample IDs noted by Client on COC? Yes  No
- Date and Time of collection noted by Client on COC? Yes  No
- Sampler's name noted on COC? Yes  No
- COC agrees with Quote? Yes  No  NA

#### Sample Receipt Information

- Custody seals intact on shipping container/cooler? Yes  No  NA
- Custody seals intact on sample bottles? Yes  No  NA
- Shipping container/cooler in good condition? Yes  No
- Samples in proper containers/bottles? Yes  No
- Sample containers intact? Yes  No
- Sufficient sample volume for indicated test? Yes  No

#### Sample Preservation and Hold Time (HT) Information

- All samples received within holding time? Yes  No  NA
- Samples Received on Ice? Yes  No

(Ice Type: WET ICE )

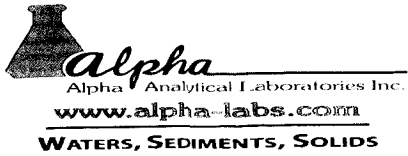

- Sample/Temp Blank temperature Temp: 2°C NA
- ZHS conditional analyses: VOA meets zero headspace requirement (VOCs, TPHg/BTEX, RSK)? Yes  No  NA
- Sample labels checked for correct preservation? Yes  No
- pH acceptable upon receipt (Metal: <2; Nitrate 353.2/4500NO3: <2; 522: <4; 218.7: >8)? Yes  No  NA

#### UCMR Samples:

- pH tested and acceptable upon receipt (200.7: ≤2; 533: 6 - 8; 537.1: 6 - 8)? Yes  No  NA
- Free Chlorine tested and acceptable upon receipt (<0.1mg/L) [not applicable to 200.7]? Yes  No  NA

**Notes and Definitions**

- OD-1 Odor described as "Aquarium"
- QM-05 The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
- ND Analyte NOT DETECTED at or above the reporting limit
- dry Sample results reported on a dry weight basis
- REC Recovery
- RPD Relative Percent Difference

\* ELAP does not offer accreditation in this matrix for the requested analyte/method combination.

## Analytical Report

**WorkOrder:** 2304F54

**Report Created for:** Alpha Analytical Laboratories

262 Rickenbacker Circle  
Livermore, CA 94551

**Project Contact:** Rachel J. Kaua

**Project P.O.:**

**Project:** 23D2586

**Project Received:** 04/21/2023

Analytical Report reviewed & approved for release on 05/08/2023 by:

Christine Askari  
Project Manager

*The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in a case narrative.*

## Glossary of Terms & Qualifier Definitions

**Client:** Alpha Analytical Laboratories

**WorkOrder:** 2304F54

**Project:** 23D2586

### Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit <sup>1</sup>
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
NA	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting limit <sup>2</sup>
RPD	Relative Percent Difference
RRT	Relative Retention Time
RSD	Relative Standard Deviation
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure

<sup>1</sup> MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016.

<sup>2</sup> RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.)

**NOTES:** \* STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U\*\* = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.

#### Chain of Custody (COC) Information

- Chain of custody present? Yes  No
- Chain of custody signed when relinquished and received? Yes  No
- Chain of custody agrees with sample labels? Yes  No
- Sample IDs noted by Client on COC? Yes  No
- Date and Time of collection noted by Client on COC? Yes  No
- Sampler's name noted on COC? Yes  No
- COC agrees with Quote? Yes  No  NA

#### Sample Receipt Information

- Custody seals intact on shipping container/cooler? Yes  No  NA
- Custody seals intact on sample bottles? Yes  No  NA
- Shipping container/cooler in good condition? Yes  No
- Samples in proper containers/bottles? Yes  No
- Sample containers intact? Yes  No
- Sufficient sample volume for indicated test? Yes  No

#### Sample Preservation and Hold Time (HT) Information

- All samples received within holding time? Yes  No  NA
- Samples Received on Ice? Yes  No

(Ice Type: WET ICE )

- Sample/Temp Blank temperature Temp: 2°C NA
- ZHS conditional analyses: VOA meets zero headspace requirement (VOCs, TPHg/BTEX, RSK)? Yes  No  NA
- Sample labels checked for correct preservation? Yes  No
- pH acceptable upon receipt (Metal: <2; Nitrate 353.2/4500NO3: <2; 522: <4; 218.7: >8)? Yes  No  NA

#### UCMR Samples:

- pH tested and acceptable upon receipt (200.7: ≤2; 533: 6 - 8; 537.1: 6 - 8)? Yes  No  NA
- Free Chlorine tested and acceptable upon receipt (<0.1mg/L) [not applicable to 200.7]? Yes  No  NA

**Laboratory Report**

**Introduction:** This report package contains a total of 3 pages divided into 3 sections:

- Case Narrative (1 page) : An overview of the work performed at FGL.
- Sample Results (1 page) : Results for each sample submitted.
- Quality Control (1 page) : Supporting Quality Control (QC) results.

**Case Narrative**

This Case Narrative pertains to the following samples:

Sample Description	Date Sampled	Date Received	FGL Lab No.	Matrix
23D2586-01 TW-1	04/18/2023	04/25/2023	SP 2306264-001	W

**Sampling and Receipt Information:**

The Sample was received in acceptable condition and within temperature requirements, unless noted on the Condition Upon Receipt (CUR) form. The Sample was received, prepared and analyzed within the method specified holding times. All samples arrived room temperature. All samples were checked for pH if acid or base preservation is required (except for VOAs). For details of sample receipt information, please see the associated Chain of Custody and Condition Upon Receipt Form.

**Quality Control:** All samples were prepared and analyzed according to established quality control criteria. Any exceptions are noted in the Quality Control Section of this report.

**Test Summary**

EPA 900.0 Preparation and analysis performed by FGL-Santa Paula (FGL-SP ELAP# 1573)

**Certification:** I certify that this data package is in compliance with ELAP standards, both technically and for completeness, except for any conditions listed above and in the QC Section. Release of the data contained in this data package is authorized by the Laboratory Director or his designee, as verified by the following electronic signature. This report shall not be reproduced except in full, without the written approval of the laboratory.

 Matrix : Water

**Sample Results - Radio**

Constituent	Result ± Error	MDA	Units	MCL/AL	DQF	Sample Preparation			Sample Analysis				
						Date	Time	Who	Method	Date	Time	Who	
<b>Radio Chemistry</b>													
Gross Alpha	11.1 ± 1.77	1.07	pCi/L	15/5		05/15/2023	07:30	amr	EPA 900.0	05/16/2023	07:03	amr	

DQF Flags Definition:

ND=Non-Detected, RL=Reporting Level

MDA = Minimum Detectable Activity (Calculated at the 95% confidence level) = Data utilized by DHS to determine matrix interference.

MCL / AL = Maximum Contamination Level / Action Level. Alpha's Action Level of 5 pCi/L is based on the Assigned Value (AV).

AV = Assigned Value(Gross Alpha Result + (0.84 x Error)). CCR Section 64442: Drinking Water Compliance Note: Do the following If Gross Alpha's (AV) exceeds 5 pCi/L run Uranium. If Gross Alpha's (AV) minus Uranium exceeds 5 pCi/L run Radium 226.

Drinking Water Compliance:

Gross Alpha (AV) minus Uranium is less than or equal to 15 pCi/L

Uranium is less than or equal to 20 pCi/L

Radium 226 + Radium 228 is less than or equal to 5 pCi/L

Note: Samples are held for 3-6 months prior to disposal.

Customer No. : 2020626

**Quality Control - Radio**

Constituent	Method	Date/ID	Type	Units	Conc.	QC Data	DQO	Note
Radio Gross Alpha	900.0	05/15/2023:205213AMR  (SP 2306961-001)	Blank	pCi/L		ND	<1.2077	
			LCS	pCi/L	140.9	97.0%	50-135	
			MS	pCi/L	140.9	81.9%	60-140	
			MSD	pCi/L	140.9	97.8%	60-140	
			MSRPD	pCi/L	140.9	14.8%	≤30	

**Definition**

- Blank : Method Blank - Prepared to verify that the preparation process is not contributing contamination to the samples.
- DQO : Data Quality Objective - This is the criteria against which the quality control data is compared.
- LCS : Laboratory Control Standard/Sample - Prepared to verify that the preparation process is not affecting analyte recovery.
- MS : Matrix Spikes - A random sample is spiked with a known amount of analyte. The recoveries are an indication of how that sample matrix affects analyte recovery.
- MSD : Matrix Spike Duplicate of MS/MSD pair - A random sample duplicate is spiked with a known amount of analyte. The recoveries are an indication of how that sample matrix affects analyte recovery.
- MSRPD : MS/MSD Relative Percent Difference (RPD) - The MS relative percent difference is an indication of precision for the preparation and analysis.
- ND : Non-detect - Result was below the DQO listed for the analyte.

Michael van den Enden

Lab Job Number: 471172  
Project No: CPT DRILLING TASK  
Location: SFO140 - Stockton Recharge  
Date Received: 10/19/22

---

This data package contains sample and QC results for two water samples, requested for the above referenced project on 10/19/22. The samples were received cold and intact.

### **Metals (EPA 200.7 and EPA 245.1):**

- Low recoveries were observed for silver in the MS/MSD of CPT-4-112 (lab # 471278-001); the LCS was within limits, and the associated RPD was within limits. High recoveries were observed for arsenic and iron; the LCS was within limits, and the associated RPDs were within limits.
- Low recoveries were observed for silver and antimony in the MS/MSD of CPT-3-100 (lab # 471172-002); the LCS was within limits, and the associated RPDs were within limits.
- No other analytical problems were encountered.

### **Ion Chromatography (EPA 300.0):**

No analytical problems were encountered.

### **Total Carbon by High-Temperature Combust (SM 5310B):**

No analytical problems were encountered.

### **Total Phosphate as P (SM 4500-P-B2-E):**

No analytical problems were encountered.

### **Alkalinity (SM2320B):**

No analytical problems were encountered.

### **Sulfide (SM 4500-S2-D):**

No analytical problems were encountered.

### **Total Dissolved Solids (TDS) (SM2540C):**

- Sample 471172-002 was reanalyzed for TDS because the originally reported value did not correspond to the field-measured conductivity. The reanalysis result is reported.
- No analytical problems were encountered.

### **Nitrate and Nitrite (EPA 353.2):**

No analytical problems were encountered.

Date Received: 10/20/22

---

This data package contains sample and QC results for four water samples, requested for the above referenced project on 10/20/22. The samples were received cold and intact.

### **Metals (EPA 200.7 and EPA 245.1):**

- Low recoveries were observed for silver in the MS/MSD of CPT-4-112 (lab # 471278-001); the LCS was within limits, and the associated RPD was within limits. High recoveries were observed for arsenic and iron; the LCS was within limits, and the associated RPDs were within limits.
- Low recoveries were observed for silver and antimony in the MS/MSD of CPT-3-100 (lab # 471172-002); the LCS was within limits, and the associated RPDs were within limits.
- No other analytical problems were encountered.

### **Ion Chromatography (EPA 300.0):**

No analytical problems were encountered.

### **Total Carbon by High-Temperature Combust (SM 5310B):**

No analytical problems were encountered.

### **Total Phosphate as P (SM 4500-P-B2-E):**

No analytical problems were encountered.

### **Alkalinity (SM2320B):**

No analytical problems were encountered.

### **Sulfide (SM 4500-S2-D):**

No analytical problems were encountered.

### **Total Dissolved Solids (TDS) (SM2540C):**

No analytical problems were encountered.

### **Nitrate and Nitrite (EPA 353.2):**

- High recoveries were observed for nitrogen, nitrate/nitrite in the MS/MSD for batch 299778; the parent sample was not a project sample, the LCS was within limits, and the associated RPD was within limits.
- No other analytical problems were encountered.

Sample Specific Notes:  
 HNO3 bottles field filled  
 Cations/Anions = Ca, Fe, Mg  
 Mn, Na, K  
 Anions = Cl, alkalinity,  
 Nitrate/nitrite, phosphate,  
 sulfide/sulfide

**Hazard Identification:** Please List any EPA Hazardous Waste? Please List any EPA Waste Codes for the sample in the this Section if the lab is to dispose of the sample.  
 Hazard  Flammable  Skin Irritant  Poison B  Unknown

**Instructions/QC Requirements & Comments:**  
 Return to Client  Disposal by Lab  Archive for \_\_\_\_\_ Months

**Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)**  
 Therm ID No.: \_\_\_\_\_  
 Date/Time: \_\_\_\_\_  
 Company: ENVIAHA-P4

Received by: Bill Berman Date/Time: 10/20/22 17:20

# ENTHALPY ANALYTICAL

## SAMPLE ACCEPTANCE CHECKLIST

**Section 1**  
 Client: Geosyntec Project: Stockton Recharge  
 Date Received: 10/21/22 Sampler's Name Present:  Yes  No

**Section 2**  
 Sample(s) received in a cooler?  Yes, How many? 2  NO (skip section 2) Sample Temp (°C) (No Cooler) : \_\_\_\_\_  
 Sample Temp (°C), One from each cooler: #1: 3.3 #2: 5.9 #3: \_\_\_\_\_ #4: \_\_\_\_\_  
*(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)*  
 Shipping Information: \_\_\_\_\_

**Section 3**  
 Was the cooler packed with:  Ice  Ice Packs  Bubble Wrap  Styrofoam  
 Paper  None  Other \_\_\_\_\_  
 Cooler Temp (°C): #1: 3.2 #2: 2.9 #3: \_\_\_\_\_ #4: \_\_\_\_\_

Section 4	YES	NO	N/A
Was a COC received?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Are sample IDs present?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Are sampling dates & times present?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Is a relinquished signature present?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Are the tests required clearly indicated on the COC?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Are custody seals present?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
If custody seals are present, were they intact?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Did all samples arrive intact? If no, indicate in Section 4 below.	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Did all bottle labels agree with COC? (ID, dates and times)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Were the samples collected in the correct containers for the required tests?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Are the containers labeled with the correct preservatives?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Is there headspace in the VOA vials greater than 5-6 mm in diameter?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Was a sufficient amount of sample submitted for the requested tests?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**Section 5 Explanations/Comments**  
 Headspace present in DO bottle.

**Section 6**  
 For discrepancies, how was the Project Manager notified?  Verbal PM Initials: \_\_\_\_\_ Date/Time \_\_\_\_\_  
 Email (email sent to/on): \_\_\_\_\_ / \_\_\_\_\_  
 Project Manager's response:

Delivery Instructions:

Signature Type: STANDARD

**ORC CA927-EH0**

Print Date: 10/17/2022 11:26 AM

Package 17 of 20

**LABEL INSTRUCTIONS:**

**Do not copy or reprint this label for additional shipments - each package must have a unique barcode.**

Step 1: Use the "Print Label" button on this page to print the shipping label on a laser or inkjet printer.

Step 2: Fold this page in half.

Step 3: Securely attach this label to your package and do not cover the barcode.

**TERMS AND CONDITIONS:**

By giving us your shipment to deliver, you agree to all of the General Logistics Systems US, Inc. (GLS) service terms & conditions including, but not limited to; limits of liability, declared value conditions, and claim procedures which are available on our website at [www.gls-us.com](http://www.gls-us.com).

This data package has been reviewed for technical correctness and completeness. Release of this data has been authorized by the Laboratory Manager or the Manager's designee, as verified by the above signature which applies to this PDF file as well as any associated electronic data deliverable files. The results contained in this report meet all requirements of NELAP and pertain only to those samples which were submitted for analysis. This report may be reproduced only in its entirety.

Date Received: 10/21/22

---

This data package contains sample and QC results for two water samples, requested for the above referenced project on 10/21/22. The samples were received cold and intact.

### **Metals (EPA 200.7 and EPA 245.1):**

- An exceedance for lead was observed in an interference check standard, however there are no relevant interferences present in these samples. Results are flagged "b" but there is no impact on the reported data.
- No analytical problems were encountered.

### **Ion Chromatography (EPA 300.0):**

No analytical problems were encountered.

### **Total Carbon by High-Temperature Combust (SM 5310B):**

No analytical problems were encountered.

### **Total Phosphate as P (SM 4500-P-B2-E):**

No analytical problems were encountered.

### **Alkalinity (SM2320B):**

No analytical problems were encountered.

### **Sulfide (SM 4500-S2-D):**

No analytical problems were encountered.

### **Total Dissolved Solids (TDS) (SM2540C):**

No analytical problems were encountered.

### **Nitrate and Nitrite (EPA 353.2):**

No analytical problems were encountered.

### SAMPLE ACCEPTANCE CHECKLIST

**Section 1**  
 Client: Geosyntec Project: Stockton Recharge  
 Date Received: 10/22/22 Sampler's Name Present:  Yes  No

**Section 2**  
 Sample(s) received in a cooler?  Yes, How many? 1  No (skip section 2) Sample Temp (°C) (No Cooler) : \_\_\_\_\_  
 Sample Temp (°C), One from each cooler: #1: 1.7 #2: \_\_\_\_\_ #3: \_\_\_\_\_ #4: \_\_\_\_\_  
 (Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)  
 Shipping Information: \_\_\_\_\_

**Section 3**  
 Was the cooler packed with:  Ice  Ice Packs  Bubble Wrap  Styrofoam  
 Paper  None  Other \_\_\_\_\_  
 Cooler Temp (°C): #1: 0.2 #2: +2 10/22/22 #3: \_\_\_\_\_ #4: \_\_\_\_\_

Section 4	YES	NO	N/A
Was a COC received?	<input checked="" type="checkbox"/>		
Are sample IDs present?	<input checked="" type="checkbox"/>		
Are sampling dates & times present?	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<u>sw</u> <u>10/22/22</u>
Is a relinquished signature present?	<input checked="" type="checkbox"/>		
Are the tests required clearly indicated on the COC?	<input checked="" type="checkbox"/>		
Are custody seals present?		<input checked="" type="checkbox"/>	
If custody seals are present, were they intact?			<input checked="" type="checkbox"/>
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)	<input checked="" type="checkbox"/>		<u>sw</u> <u>10/22/22</u>
Did all samples arrive intact? If no, indicate in Section 4 below.	<input checked="" type="checkbox"/>		
Did all bottle labels agree with COC? (ID, dates and times)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<u>sw</u> <u>10/22/22</u>
Were the samples collected in the correct containers for the required tests?	<input checked="" type="checkbox"/>		
Are the containers labeled with the correct preservatives?	<input checked="" type="checkbox"/>		
Is there headspace in the VOA vials greater than 5-6 mm in diameter?		<input checked="" type="checkbox"/>	
Was a sufficient amount of sample submitted for the requested tests?	<input checked="" type="checkbox"/>		

**Section 5 Explanations/Comments**  
No sample dates on COC. Containers included sample times of 8:30 for sample 1 and 9:30 for sample 2.

**Section 6**  
 For discrepancies, how was the Project Manager notified?  Verbal PM Initials: \_\_\_\_\_ Date/Time \_\_\_\_\_  
 Email (email sent to/on): \_\_\_\_\_ / \_\_\_\_\_

**Delivery Instructions:**

**Signature Type: STANDARD**

**ORC CA927-EH0**

Print Date: 10/14/2022 3:54 PM

Package 4 of 8

**LABEL INSTRUCTIONS:**

- Do not copy or reprint this label for additional shipments - each package must have a unique barcode.**
- Step 1: Use the "Print Label" button on this page to print the shipping label on a laser or inkjet printer.
- Step 2: Fold this page in half.
- Step 3: Securely attach this label to your package and do not cover the barcode.

**TERMS AND CONDITIONS:**

By giving us your shipment to deliver, you agree to all of the General Logistics Systems US, Inc. (GLS) service terms & conditions including, but not limited to; limits of liability, declared value conditions, and claim procedures which are available on our website at [www.gls-us.com](http://www.gls-us.com).

Rancho Cordova, CA 95670  
Haley Miller

Lab Job Number: 479515  
Project No: CPT DRILLING TASK  
Location: SFO140 - DWTP  
Dates Received: 02/14/23, 02/15/23

---

This data package contains sample and QC results for six water samples, requested for the above referenced project on 02/14/23. The samples were received cold and intact.

### **Metals (EPA 200.7 and EPA 245.1):**

- Low recoveries were observed for selenium in the MS/MSD of MW-1-D-20230214 (lab # 479515-001); the LCS was within limits, and the associated RPD was within limits. High recoveries were observed for iron; the LCS was within limits, and the associated RPD was within limits.
- No other analytical problems were encountered.

### **Ion Chromatography (EPA 300.0):**

No analytical problems were encountered.

### **Total Carbon by High-Temperature Combust (SM 5310B):**

No analytical problems were encountered.

### **Total Phosphate as P (SM 4500-P-B2-E):**

No analytical problems were encountered.

### **Alkalinity (SM2320B):**

No analytical problems were encountered.

### **Sulfide (SM 4500-S2-D):**

No analytical problems were encountered.

### **Total Dissolved Solids (TDS) (SM2540C):**

No analytical problems were encountered.

### **Nitrate and Nitrite (EPA 353.2):**

No analytical problems were encountered.

# ENTHALPY ANALYTICAL

## SAMPLE ACCEPTANCE CHECKLIST

**Section 1**  
 Client: Geosyntec Project: SF0140  
 Date Received: 2/15/23 Sampler's Name Present:  Yes  No

**Section 2**  
 Sample(s) received in a cooler?  Yes, How many? 1  No (skip section 2) Sample Temp (°C) (No Cooler) : \_\_\_\_\_  
 Sample Temp (°C), One from each cooler: #1: 2.9 #2: \_\_\_\_\_ #3: \_\_\_\_\_ #4: \_\_\_\_\_  
*(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)*  
 Shipping Information: \_\_\_\_\_

**Section 3**  
 Was the cooler packed with:  Ice  Ice Packs  Bubble Wrap  Styrofoam  
 Paper  None  Other \_\_\_\_\_  
 Cooler Temp (°C): #1: 1.9 #2: \_\_\_\_\_ #3: \_\_\_\_\_ #4: \_\_\_\_\_

Section 4	YES	NO	N/A
Was a COC received?		<input checked="" type="checkbox"/>	
Are sample IDs present?	<input checked="" type="checkbox"/>		
Are sampling dates & times present?	<input checked="" type="checkbox"/>		
Is a relinquished signature present?	<input checked="" type="checkbox"/>		
Are the tests required clearly indicated on the COC?	<input checked="" type="checkbox"/>		
Are custody seals present?		<input checked="" type="checkbox"/>	
If custody seals are present, were they intact?			<input checked="" type="checkbox"/>
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			<input checked="" type="checkbox"/>
Did all samples arrive intact? If no, indicate in Section 4 below.	<input checked="" type="checkbox"/>		
Did all bottle labels agree with COC? (ID, dates and times)	<input checked="" type="checkbox"/>		
Were the samples collected in the correct containers for the required tests?	<input checked="" type="checkbox"/>		
Are the containers labeled with the correct preservatives?		<input checked="" type="checkbox"/>	
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			<input checked="" type="checkbox"/>
Was a sufficient amount of sample submitted for the requested tests?		<input checked="" type="checkbox"/>	

**Section 5 Explanations/Comments**  
 Page 2 of 2 not received.  
 Sample 3: received 4 containers.  
 Sample 4: received 1 containers.  
 Did not receive samples 5 and 6.

**Section 6**  
 For discrepancies, how was the Project Manager notified?  Verbal PM Initials: \_\_\_\_\_ Date/Time \_\_\_\_\_  
 Email (email sent to/on): \_\_\_\_\_ / \_\_\_\_\_  
 Project Manager's response:  
 \_\_\_\_\_

Completed By:  Date: FEB 15 2023

# ENTHALPY ANALYTICAL

## SAMPLE ACCEPTANCE CHECKLIST

### Section 1

Client: Geosyntec Consultants

Project: SFO140 - DWTP

Date Received: 02/16/23

Sampler's Name Present:  Yes  No

### Section 2

Sample(s) received in a cooler?  Yes, How many? 1  No (skip section 2) Sample Temp (°C) (No Cooler) : \_\_\_\_\_

Sample Temp (°C), One from each cooler: #1: 2.1 #2: \_\_\_\_\_ #3: \_\_\_\_\_ #4: \_\_\_\_\_

*(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)*

Shipping Information: Southwest Airlines

### Section 3

Was the cooler packed with:  Ice  Ice Packs  Bubble Wrap  Styrofoam  
 Paper  None  Other \_\_\_\_\_

Cooler Temp (°C): #1: 1.6 #2: \_\_\_\_\_ #3: \_\_\_\_\_ #4: \_\_\_\_\_

### Section 4

	YES	NO	N/A
Was a COC received?	<input checked="" type="checkbox"/>		
Are sample IDs present?	<input checked="" type="checkbox"/>		
Are sampling dates & times present?	<input checked="" type="checkbox"/>		
Is a relinquished signature present?	<input checked="" type="checkbox"/>		
Are the tests required clearly indicated on the COC?	<input checked="" type="checkbox"/>		
Are custody seals present?		<input checked="" type="checkbox"/>	
If custody seals are present, were they intact?			<input checked="" type="checkbox"/>
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			<input checked="" type="checkbox"/>
Did all samples arrive intact? If no, indicate in Section 4 below.	<input checked="" type="checkbox"/>		
Did all bottle labels agree with COC? (ID, dates and times)	<input checked="" type="checkbox"/>		
Were the samples collected in the correct containers for the required tests?	<input checked="" type="checkbox"/>		
Are the containers labeled with the correct preservatives?	<input checked="" type="checkbox"/>		
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			<input checked="" type="checkbox"/>
Was a sufficient amount of sample submitted for the requested tests?	<input checked="" type="checkbox"/>		

### Section 5 Explanations/Comments

Received samples for -004 (4 containers), -005 (1 container) and -006 (4 containers) with page 2/2 of the cocs.

### Section 6

For discrepancies, how was the Project Manager notified?  Verbal PM Initials: \_\_\_\_\_ Date/Time \_\_\_\_\_  
 Email (email sent to/on): \_\_\_\_\_ / \_\_\_\_\_

Project Manager's response:

Completed By: [Signature] Date: 2/16/23

# Step-Drawdown Test Files

Report Date: 4/17/2023 9:24  
Report User Name: JTurner  
Report Computer Name: SAC-JTURNER  
Application: WinSitu.exe  
Application Version: 5.7.8.0

#### Log File Properties

File Name MW-1-D\_2023-04-17\_09-23-02-580.wsl  
Create Date 4/17/2023 9:22

#### Device Properties

Device Level TROLL 700  
Site DWTP  
Device Name  
Serial Number 985464  
Firmware Version 3.06  
Hardware Version 5  
Device Address 1  
Device Comm Cfg 19200 8 Even 1 (Modbus-R  
Used Memory 14  
Used Battery 1

#### Log Configuration

Log Name MW-1-D  
Created By Haley.Miller  
Computer Name SAC-HMILLER  
Application WinSitu.exe  
Application Version 5.7.8.0  
Create Date 2/16/2023 6:34:32 PM Pacific Standard Time  
Log Setup Time Zone Pacific Standard Time  
Notes Size(bytes) 4096  
Overwrite when full Disabled  
Scheduled Start Time Manual Start  
Scheduled Stop Time No Stop Time  
Type Linear  
Interval Days: 0 hrs: 01 mins: 00 secs: 00

#### Level Reference Settings At Log Creation

Level Measurement N Depth  
Specific Gravity 0.999

#### Other Log Settings

Depth of Probe: 47.8478 (ft)

Head Pressure: 20.7226 (PSI)  
 Temperature: 18.5801 (C)

Log Notes:
